Feedmax -P – single diameter drills

Designed for high productivity and low cost per hole offering a unique combination of state-of-the-art carbide, coating and geometry technology.

- Self-centering geometry for high quality holes with no need for center-drilling operation.
- A special TiAlN coating gives Seco Feedmax drills high hot hardness that in combination with a strong cutting edge, ensures for long and predictable tool life

SD203A-P

Drilling depth ~ 3 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 145-146
- For intermediate diameters see the MyDesign software.

SD205A-P

Drilling depth ~ 5 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 147-148
- For intermediate diameters see the MyDesign software.

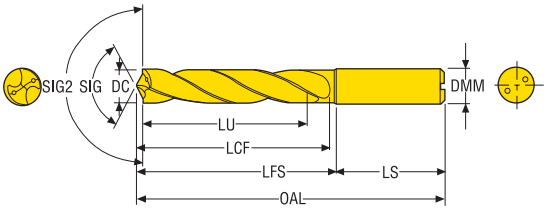
Feedmax™ SD245A



Seco Feedmax SD245A solid carbide drills bring high levels of stability and overall improved machining performance to holemaking applications with irregular exits and cross-hole interruptions. The following features enable the user to achieve good hole geometry:

- Four land margins
- An optimized self-centering point
- Highly wear-resistant TiAlN+TiN coating
- Enhanced edge preparation

SD245A

Drilling depth ~ 5 x D – Metric/Inch

Feedmax™ SD265A

Seco Feedmax SD265A IT 7 high precision drills offer impeccable accuracy. Additionally, one SD265A drill can take the place of multiple tools and simplify complex drilling tasks. The following features enable the user to drill holes in a single pass:

- Optimized drill geometry and self-centering point
- Total of 6 land margins
- Tight manufacturing tolerances (±3µ)
- TiAlN coating for low friction and great wear resistance

SD265A

Drilling depth ~ 5 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- Internal coolant
- For cutting data see page(s) 156
- For intermediate diameters see the MyDesign software.

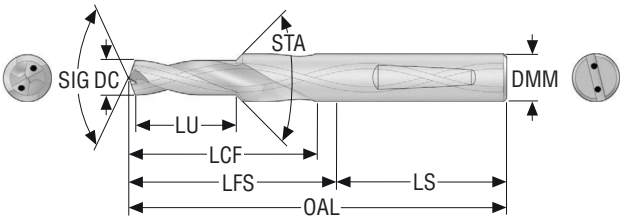
Feedmax™ – Chamfer drills

Seco Feedmax™ chamfer drills combine drilling and chamfering into a single process to maximize efficiency. The standard stocked range covers pre-drilling applications for common standard metric threads from M4 to M16.

- Special design minimizes cost per hole and increases productivity
- Special low friction coating provides high hot hardness and excellent chip evacuation
- The self-centering geometry provides high hole quality using a 45-degree (90-degree included angle) chamfer angle

Chamfer drills – M4 - M16 Thread

Metric/Inch



- Cylindrical shank DIN 6537A
- Internal coolant
- Coating: TiAlN + TiN
- Hole tolerance: IT8-9
- Included chamfer angle = 90°
- For cutting data see page(s) 145, 146

To be used with cylindrical shank only (R1).

SD203A, -MS

Drilling depth ~ 3 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 157-158
- For intermediate diameters see the MyDesign software.

SD205A, -MS

Drilling depth ~ 5 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 159-160
- For intermediate diameters see the MyDesign software.

SD203A, -M

Drilling depth ~ 3 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 161-162
- For intermediate diameters see the MyDesign software.

SD205A, -M

Drilling depth ~ 5 x D – Metric/Inch

- Cylindrical shank DIN 6537A
- DC tolerance m7
- Internal coolant
- For cutting data see page(s) 163- 164
- For intermediate diameters see the MyDesign software.

Composite drilling

Seco offers two distinct solutions for composite drilling: diamond-coated drills and polycrystalline diamond (PCD) drills. These tools feature geometries that are optimized specifically for regular composites or stacked materials.

- C1 and CX1 point geometry optimized for applications existing in CFRP material
- The C2:s flat geometry drill point machines stacked composite materials that incorporate layers of aluminum
- CX1 are polycrystalline diamond (PCD) drills that offer enhanced productivity and long tool life over conventional drills when machining composite materials
- Both C1 and C2 are diamond-coated carbide drills featuring a Dura diamond coating that provides very good toughness and abrasive resistance

Composite machining

When hole quality is in focus

With issues like entrance and exit delamination and splintering, the focus has been clear; design tools specifically optimized for composite applications, and tools specifically optimized for sandwich materials.
In both cases particular consideration was given to achieving excellent performance in both entering and exiting. (In sandwich material this usually involves
exiting in either Al or Ti).

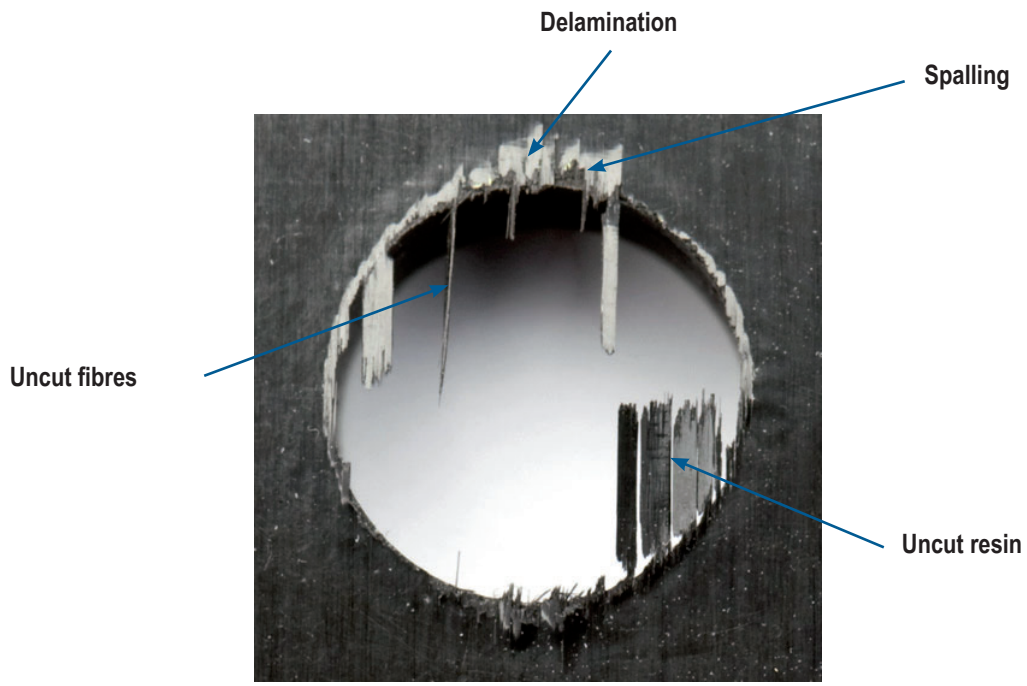
- No push-up delamination (entrance)
- No pull-down delamination (exit)

The Dura diamond coating secures good dimensional tolerance throughout the long tool life.

Application sample

Plain CFRP/GFRP
(exit in composite material)

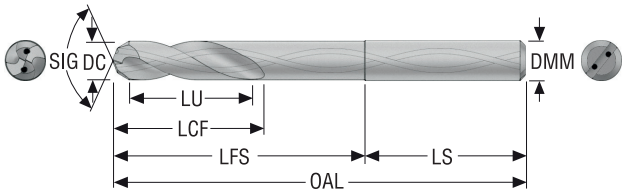
C1 geometry
CX1 geometry



Sandwich material
(exit in Al/Ti)

C2 geometry

Troubleshooting – Hole exit



Problem:	Delamination (peel up / push down)	Spalling	Uncut fibres	Uncut resin
Solution:	**Peel up** ▪ Use tool with more negative geometry ▪ Reduce feed/rev **Push down** ▪ Reduce feed/rev	▪ Use tool with more positive geometry ▪ Reduce feed/rev	▪ Use tool with a sharper geometry ▪ Reduce feed/rev	▪ Use tool with a sharper geometry ▪ Reduce feed/rev ▪ Reduce cutting speed
Problem:	**Melted resin (too much heat)**	**Poor tool life**		
Solution:	▪ Reduce cutting speed	▪ Reduce cutting speed

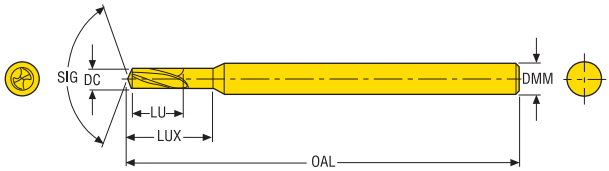
Micro drilling



Seco addresses micro drilling applications with a portfolio of dedicated products that includes the SD22 and SD26 ranges of small solid carbide micro drills.

- Capable of delivering dramatic performance increases compared to traditional HSS drills
- Suitable for applications in the automotive and medical industries, as well as for small part production in the general engineering industry

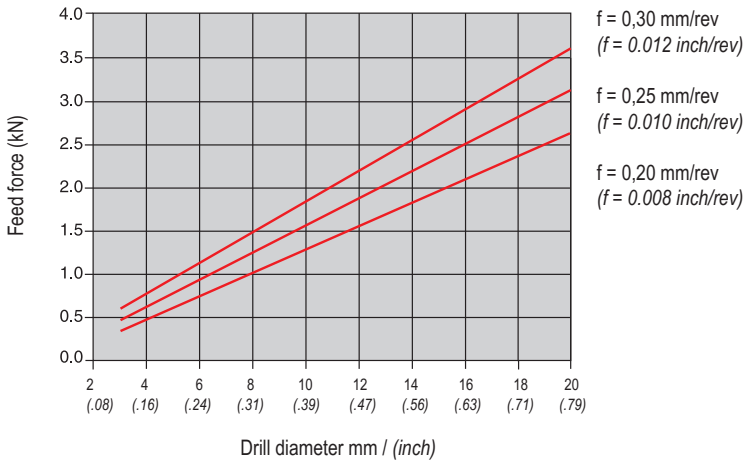
Machining data



Net power consumption

Coolant flow at different pressures

Feed force

Method:
Adjust feed up or down to obtain as good chip formation as possible. Increased feed/rev gives shorter chips.

The values showing feed force and net power consumption above are basic values and vary with type of cutting data, material and tool wear.

Machining data

SD1103, SD1103A, SD1105A, SD203A, SD205A, SD206, SD206A, SD207A, SD216A, SD230A IT8–9/R_a 1–3*

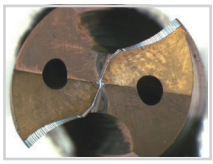
*Deterioration of surface finish can occur when drilling in low carbon steel or stainless steel.

Troubleshooting – Initial check points

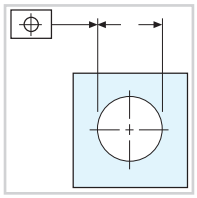
- Fixturing stability
- Machine spindle condition
- Tool holder condition



- Clamping of tool:
  - Run-out within 0,04 TIR
  - If using pre drilling within 0,04 TIR

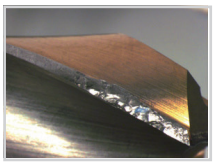
- Chip evacuation:
  - Cutting data

- Coolant:
  - Pressure
  - Flow
  - Concentration



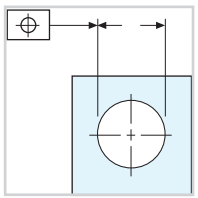
Rapid flank wear

- Reduce the cutting speed
- Increase coolant concentration



Unsatisfactory diameter tolerance

- Increase the feed/rev
- Use a reaming operation, see page(s) 327
- Use a boring operation, see page(s) 516-517

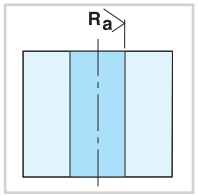


Wear/Periphery land

- Reduce the cutting speed
- Increase coolant concentration

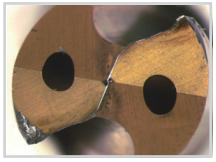
Unsatisfactory positioning of the hole

- Reduce feed/rev on entrance
- Reduce feed/rev
- Use a boring operation, see page(s) 516-517
- If drilling through rough, hard and angled surfaces - reduce the feed by 30-50% during entrance and exit
- Centre drill with a 140° point angle



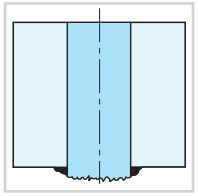
Chipping/Centre

- Reduce feed/rev on entrance
- Reduce feed/rev
- Use a boring operation, see page(s) 516-517



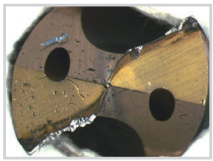
Unsatisfactory surface finish

- Reduce the feed/rev
- Increase the cutting speed
- Use a reaming operation, see page(s) 327



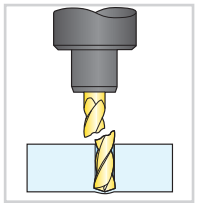
Chipping/Outer corner, cutting edge

- Reduce feed during entrance/exit
- Reduce the cutting speed
- Increase coolant concentration
- Regrind the drill



Burrs on exit

- Reduce the feed/rev on exit
- Reduce the width of edge preparation (BN)

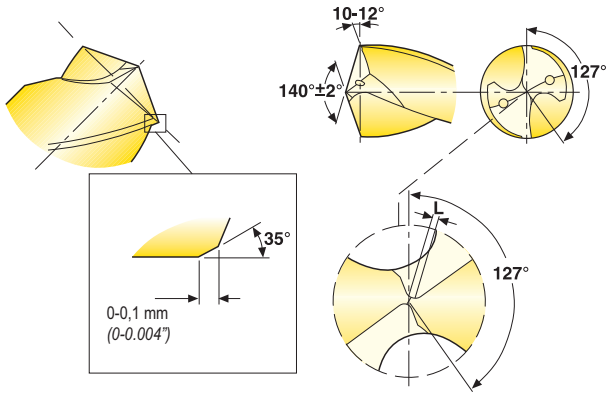


Built-up edge

- If closer to the periphery increase the cutting speed
- If closer to centre increase feed/rev
- If the drill is worn, regrind it

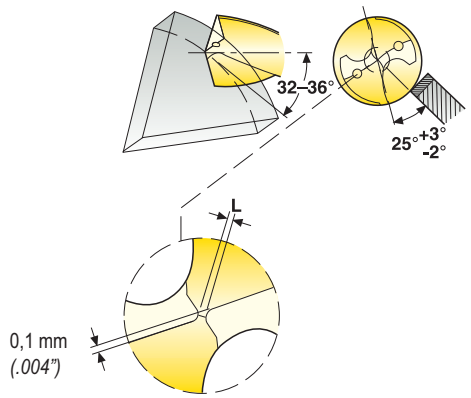
Breakage on contact/at hole bottom

- Reduce the feed/rev during entrance/exit
- Adjust cutting data for improved chip evacuation



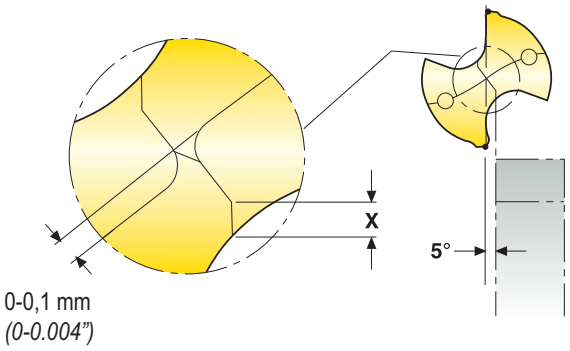
Regrinding instructions for SD1103, SD1103A, SD1105A, SD1108A and SD1112A

Specifications:
Proposed specification of diamond wheels:
Point relief: Wheel shape12A2 Grit size D54 (picture 1).
Gashing: Wheel shape 1A1 or 1V1 Grit size D64-D46 (picture 2-3).
Corner chamfer: Wheel shape 1A1 or 12A2 (picture 1).
Edge treatment: grinding K-land or brushing (picture 4).



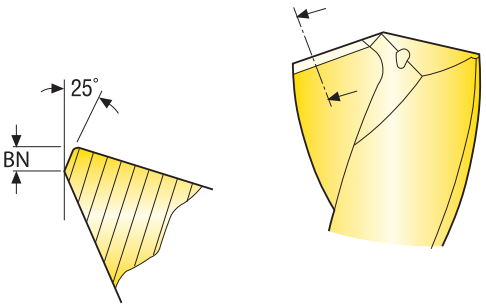
Important:
- The cutting edges must be uniform and have the same size of edge preparation.
- The edge preparation must be applied on the whole length of the cutting edges.

1. Four facet point



Lip height distance (axial run-out) to be within 0,02 mm *(0.008")*

2. Web thinning



Drill ∅ DC mm	L mm	Drill ∅ DC *inch*	L *inch*
2-10	0,1-0,3	*0.079-0.394*	*0.004-0.012*
10-20	0,2-0,4	*0.394-0.787*	*0.008-0.016*

3. Grinding of flat X

X = 0,08 x (0.003) x drill diameter DC

4. Edge preparation

Workpiece material	BN			
	Drill ∅ ≤ 10 mm	Drill ∅ > 10 mm	Drill ∅ ≤ 0.394 *inch*	Drill ∅ > 0.394 *inch*

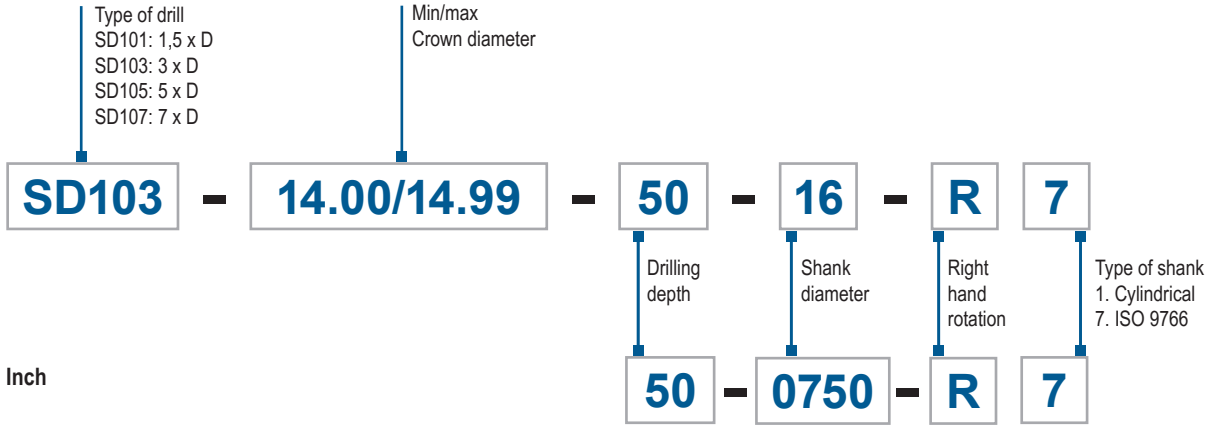
Seco Crownloc®

Seco Crownloc® is a range of exchangeable tip drills designed to offer high quality holes at a lower cost. Matching the quality of high precision drills, Crownloc uses replaceable crowns to eliminate the need for and cost of regrinding.

- Double coolant holes through the crown permit a high volume of coolant to reach the cutting edges
- Crownloc® is available in a large range of optimized tip geometries for different applications and workpiece materials

Range overview



Crownloc®	∅ Range	Drill depth	Drill ∅ tolerance	Hole tolerance (1)	Surface finish (2)
SD101  Page(s) 175-176	12,00-25,99 mm *(0.472-1.023")*	1,5 x D	k7	IT 10	Ra 1-3 µm *(Ra 39-118 µin)*
SD103  Page(s) 177-178	9,52-25,99 mm *(0.375-1.023")*	3 x D	k7	IT 10	Ra 1-3 µm *(Ra 39-118 µin)*
SD105  Page(s) 179-180	10,00-25,99 mm *(0.394-1.023")*	5 x D	k7	IT 10	Ra 1-3 µm *(Ra 39-118 µin)*
SD107  Page(s) 181-182	12,00-25,99 mm *(0.472-1.023")*	7 x D	k7	IT 10	Ra 1-4 µm *(Ra 39-157 µin)*
Chamfer module  Page(s) 190	12.00-19,99 mm *(0.472-0.787")*	–	–	–	–

1) Variations can occur depending on the material and the cutting data used.
2) Drill depth, cutting data, coolant pressure and material can cause deterioration of the surface finish.

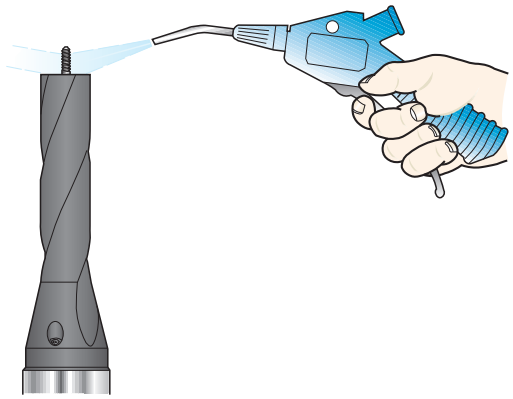
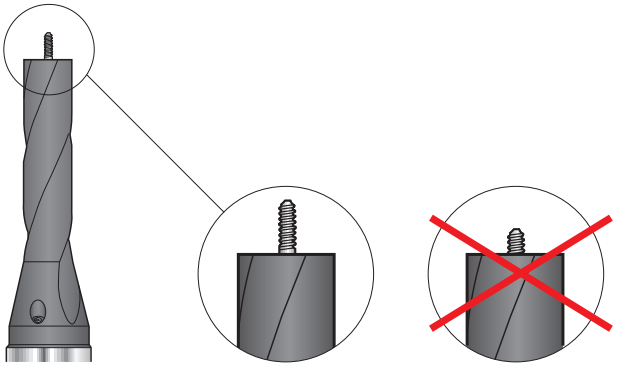
Mounting instructions



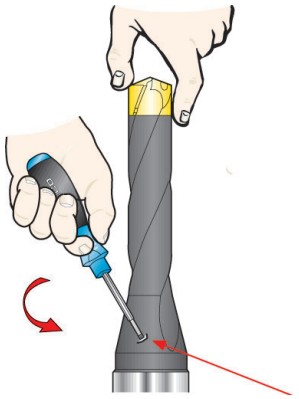
1. Clean the locking interface of the drill body carefully to remove any chips or debris.
2. Make sure that the pull rod is fully extended.
3. Mount new crown onto the pull rod and turn it until it reaches the bottom of the thread.

Turn the crown slightly counterclockwise (backwards) until the locking interfaces fit.
Push the crown towards the body into the right position while turning the clamping screw.
Make sure the interfaces fit.
Tighten the clamping screw firmly using the torque key.



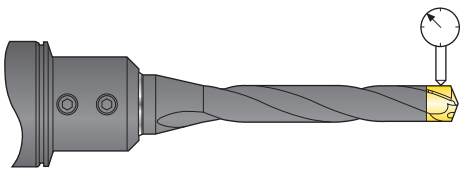
Stability
The stability of the applicationis important in obtaining the best tool life and hole accuracy. Check the condition of the machine spindle, fixture and fixturing of the component to secure maximum stability and rigidity. Unstable conditions can cause tool breakages.

Rotating
Total Indicated Run-out (TIR) should not exceed 0,06 mm *(0.002")* in a rotating application. Measure the run-out when the drill is mounted in the spindle.



1.

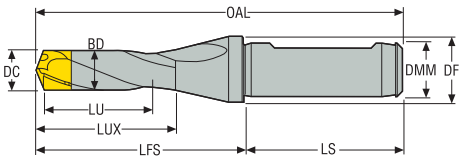
2.



3.

Drill ∅ DC mm	M_c Nm	Drill ∅ DC *inch*	M_c *in/lbs*
10,00-13,99	0,8-1,0	*0.394-0.551*	*7-9*
14,00-16,99	1,8-2,2	*0.551-0.669*	*16-19.5*
17,00-25,99	2,5-3,0	*0.669-1.023*	*22-26*

Stationary
The distance between the drill point and the rotating center of the workpiece should not exceed 0.03 mm *(0.001")* radially in a stationary application.



Recommended tool holders
For best results, use holders type DIN 1835 B/DIN 6535 HB (Weldon). For further information see Tooling catalog.

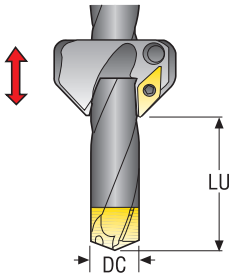
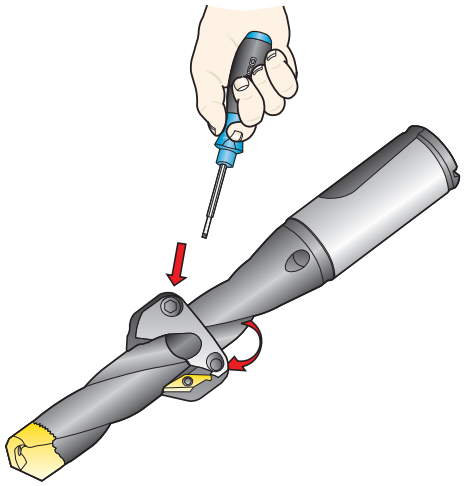
Chamfer module – Mounting instruction/placement of module

1. Fit the module on the drill without chamfer insert or crown mounted.



2.1 If possible, place the module as close to the shank as possible.



DC		LU drilling depth (min-max)			
		SD101		SD103

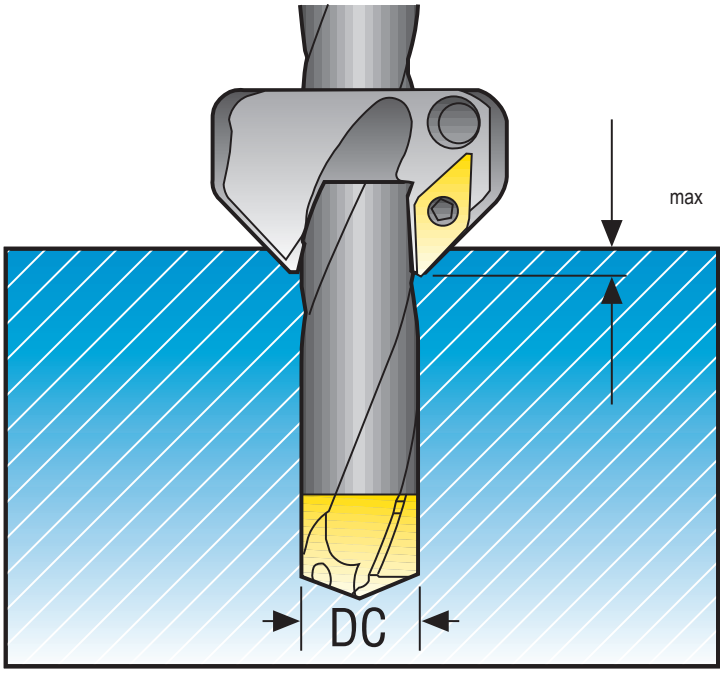
3. Tighten both screws according to the table below.

DC		M	
mm	*inch*	Nm	*in-lbs*
12-19	*.472-.748*	3-4	*26-35*



Chamfer module

The recommended cutting speeds and feeds for Crownloc® on pages 193-196 should also be used during the chamfering operation.

Troubleshooting

Vibrations during chamfering	• Reduce cutting speed • If possible, move the module closer to the shank of the drill • If possible, use a shorter drill

SMG = Seco material group f = mm/rev (IPR) v_c = m/min (sf/min) All cutting data are start values

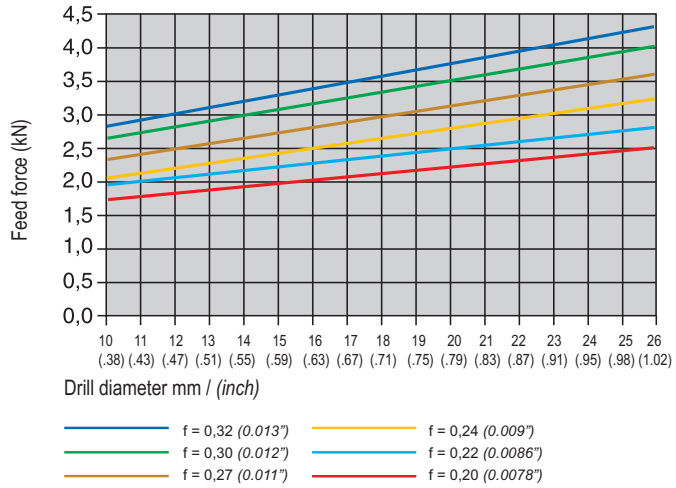
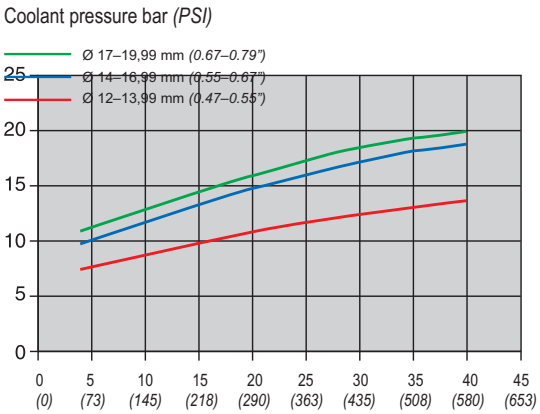
Machining data

The values in the graphs vary with e.g. cutting data, material, efficiency of the machine and tool wear.
The graphs below are valid for Seco Material Group (SMG) P5-P6 and cutting speed 90 m/min *(295 sf/min)*.

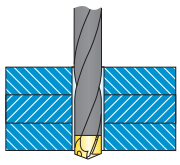


Net power consumption



Drilling torque

Feed force



Coolant flow at different pressures

Recommended coolant flow Dx1 l/min
Minimum coolant flow D/2 l/min
D = Drill diameter
Minimum recommended coolant pressure 10 bar *(145 PSI)* with < 3 x D
Minimum recommended coolant pressure 20 bar *(290 PSI)* with > 3 x D
Minimum recommended coolant pressure 40 bar *(580 PSI)* with > 5 x D

Coolant mix
Recommended emulsion mix is 6–8%.
When drilling in stainless steels, superalloys and high strength steels a mix of 10% is recommended.

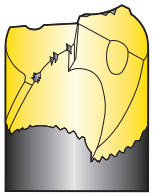
Machining recommendations
It is possible to drill stacked material as long as the pieces are securely clamped together, so that there are no air gaps between the parts. Air gaps can affect chip evacuation, and thereby damage the drill.

Hole tolerances/Surface finish

SD101, SD103, SD105 and SD107 IT9-10 / R_a 1-4*, R_a 39-157 µin*					
Drill ∅ DC (mm)	IT9 tolerance (µm)	IT10 tolerance (µm)	Drill ∅ DC *(inch)*	IT9 tolerance *(inch)*	IT10 tolerance *(inch)*
0 – +10-18	0 – +43	0 – +70	*0 – +0.394-0.709*	*0 – +0.0017*	*0 – +0.0028*
0 – +18-30	0 – +52	0 – +84	*0 – +0.709-1.181*	*0 – +0.0020*	*0 – +0.0033*

*Deterioration of surface finish and hole tolerance can occur when drilling in low carbon steel or stainless steel. Use the shortest drill possible for best hole quality.

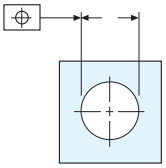
Troubleshooting – Initial check points:



- Fixturing stability
- Machine spindle condition
- Tool holder condition

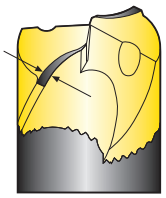
- Clamping of tool:
  - Run-out within 0,06 TIR

- Chip evacuation:
  - Cutting data



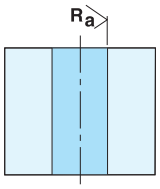
- Coolant:
  - Pressure
  - Flow
  - Concentration

Cutting edges get chipped



- Reduce the feed/rev
- If the drill vibrates, reduce the cutting speed and increase the feed rate
- When drilling through rough, hard or angled surfaces, reduce the feed rate by 30%-50% during entrance and exit

Unsatisfactory diameter tolerance

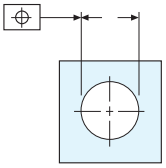


- Increase the feed/rev
- Use a Seco Feedmax solid carbide drill, see page(s) 15-17
- Use a reaming operation, see page(s) 327
- Use a boring operation, see pages(s) 516-517

Too fast flank wear

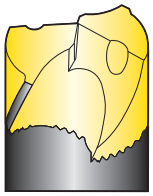
- Check that correct geometry is used
- Reduce the cutting speed

Unsatisfactory surface finish



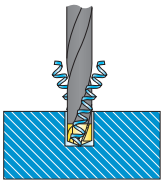
- Reduce the feed/rev
- Increase the cutting speed
- Check that the correct geometry is used
- Use a Seco Feedmax solid carbide drill, see page(s) 15-17
- Use a reaming operation, see page(s) 327

Groove wear



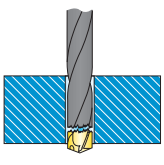
- Reduce the feed /rev
- Reduce the cutting speed
- Increase the coolant concentration

Unsatisfactory positioning of the hole



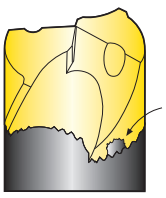
- Reduce the feed/rev
- If drilling through rough, hard and angled surface - reduce the feed by 30%-50% during entrance and exit
- Pre drill with a 140˚ point angle
- Use a Seco Feedmax solid carbide drill see Feedmax page(s) 15-17
- Use a boring operation, see page(s) 516-517

Wear of peripheral land margins



- Check that the correct geometry is used
- Reduce the cutting speed
- Increase the coolant concentration
- When drilling through rough, hard or angled surfaces, reduce the feed rate by 30-50% during entrance and exit

Chip jamming due to long chips



- Increase the feed
- In long chipping materials SMG P1-P4, SMG M1-M2:
  - Increase cutting speed and reduce feed/rev
  - Use the L geometry (MyDesign)

Breakage at hole exit

- If the crown connection breaks when the crown is just about to break through the material. The failure is caused by:
  - The interface has not been cleaned thoroughly and there is still dirt or chips left between crown and drill body
  - The crown has not been clamped securely. Use the torque key
  - Too few threads are holding the crown

Chipping of the locking interface

- Minor chipping is not hazardous to the locking system. It will not affect the drilling result
- If major chipping occurs when using a high feed rate or when drilling through angled surfaces - reduce the feed rate

Crownloc® Plus

Seco Crownloc® Plus is a new generation of Seco drills with exchangeable crowns. Featuring a new locking interface, Crownloc Plus improves chip evacuation and wear resistance in a variety of materials.

- Strong drill body design, high-strength locking interface with deep and wide flutes and polished body
- The first choice for general applications, the P geometry is a strong and versatile solution
- The M geometry provides excellent performance in high temperature alloys, titanium, titanium alloys and stainless steel

Range overview

Crownloc® Plus	∅ Range	Drill depth	Drill ∅ tolerance	Hole tolerance (1)	Surface finish (2)
SD403  Page(s) 203-206	12,00-19,99 mm *(0.472-0.787")*	~ 3 x D	k7	IT 9-10	Ra 1-3 µm *(Ra 39-118 µin)*
SD405  Page(s) 207-210	12,00-19,99 mm *(0.472-0.787")*	~ 5 x D	k7	IT 10	Ra 1-3 µm *(Ra 39-118 µin)*
SD408  Page(s) 211-214	12,00-19,99 mm *(0.472-0.787")*	~ 8 x D	k7	IT 10	Ra 1-3 µm *(Ra 39-118 µin)*

1) Variations can occur depending on the material and the cutting data used.
2) Drill depth, cutting data, coolant pressure and material can cause deterioration of the surface finish.

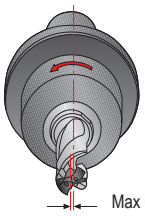
Geometries

P-geometry
- Universal geometry, first choice for drilling in steel

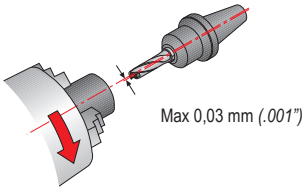
M-geometry
- For stainless steels and high temp alloys



Mounting instructions

1. Stability

The stability of the application is important to obtain the best tool life and hole accuracy. Check the condition of the machine spindle, fixture and fixturing of the component to secure maximum stability and rigidity.
Unstable conditions can cause tool breakages.



2. Rotating

Total Indicated Run-out (TIR) should not exceed 0.06 mm *(0.002")* in a rotating application.
Measure the run-out when turning the drill 360° in the spindle.

3. Stationary

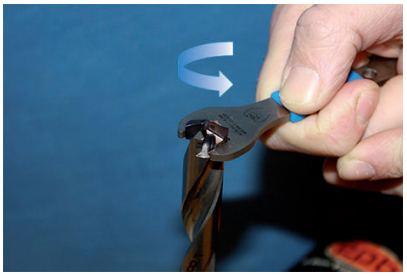
The distance between the drill point and the rotating center of the workpiece should not exceed 0.03 mm *(0.001")* radially in a stationary application.

4. Recommended tool holders

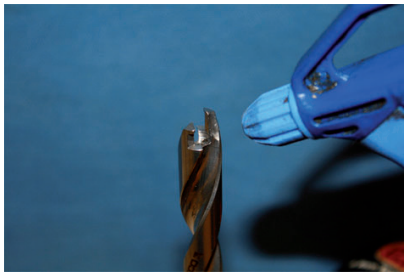
Seco Tools offers a wide range of tools holders (Collet chucks, Shrinkfit holders, Weldon Hydraulic chucks...), available for a variety of machine spindle types.
For best results, use holders type ERHP 5672, High precision chuck.
For further information see Tooling Systems catalog.

High precision collet chuck
(For cylindrical, -R1 shanks only)

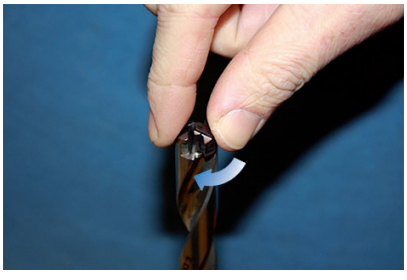
Hydraulic chuck
(For cylindrical, -R1 shanks only)



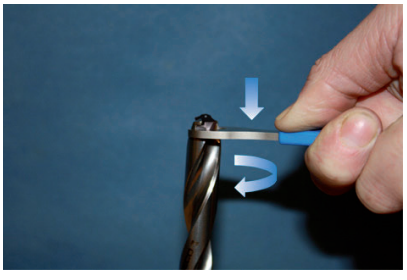
Weldon



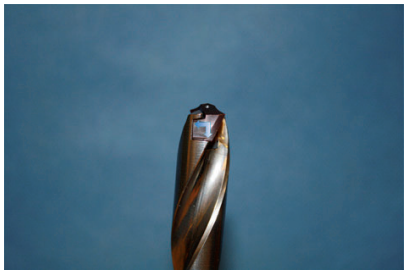
1.
To unclamp the crown, find the two flats on the Crown for the key.



2.
Turn the key counterclockwise to unclamp it with a quarter of a turn.

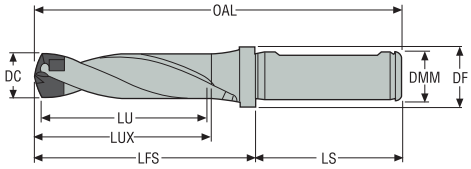


3.
Clean the connection, before mounting the crown.



4.
Pre-clamp the crown with your fingers for easier clamping, before using the key.

5.
Simultaneously press down the crown when clamping on a quarter of a turn clockwise using the key and keep it perpendicular to the drill body.



6.
When the crown is mounted in the drill body, full contact should be achieved in the connection between the suporting surfaces of the drill body and the Crown, see picture.

SMG = Seco material group f = mm/rev (IPR) v_c = m/min (sf/min) All cutting data are start values

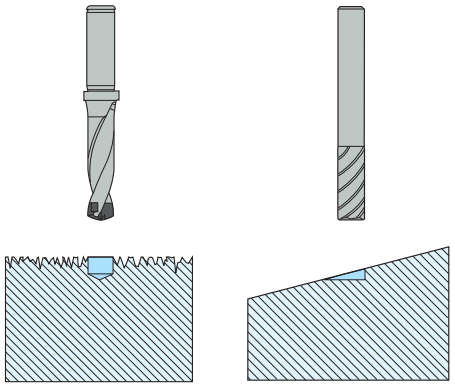
Application information

Application information

Machined suface
No pre-drilling or entrance feed needed when using SD403 and SD405. When using a SD408 drill body pre-drilling is always recommended. (When using SD405 in stainless steel a pre-drilling operation might be needed.)

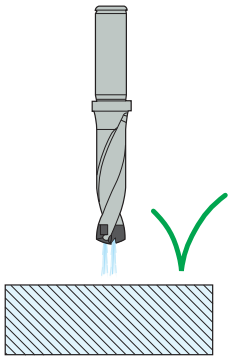


Stacked material
It is possible to drill stacked material as long as the pieces are securely clamped together, so that there are no air gaps between the parts. Air gaps can affect chip evacuation, and thereby damage the drill.

Irregular/Angled hole entrance

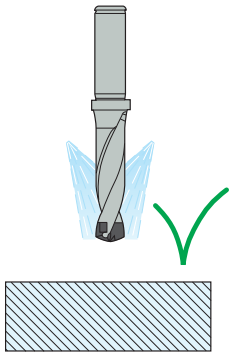
If irregular or angle entrance use pre operations accordingly. When using drills > 3 x D pre-drilling with a standard tool e.g. SD403 is recommended

Pre-drilling operation alternatives



Irregular hole entrance

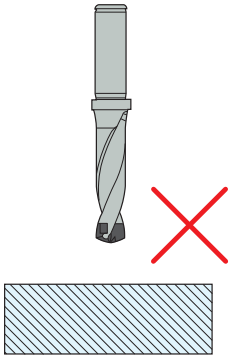
Angled hole entrance



Machine a flat using an end mill from the Seco range.

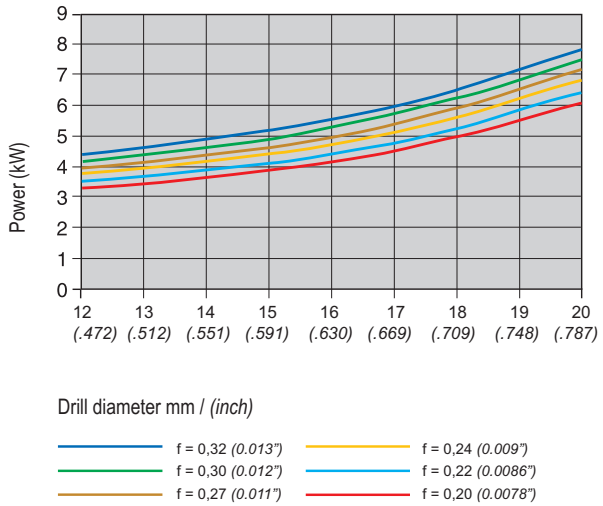
Coolant recommendations

Coolant pressure
Minimum recommended coolant pressure 10 bar (145 PSI) with ≤ 3 x D
Minimum recommended coolant pressure 30 bar (435 PSI) with > 3 x D

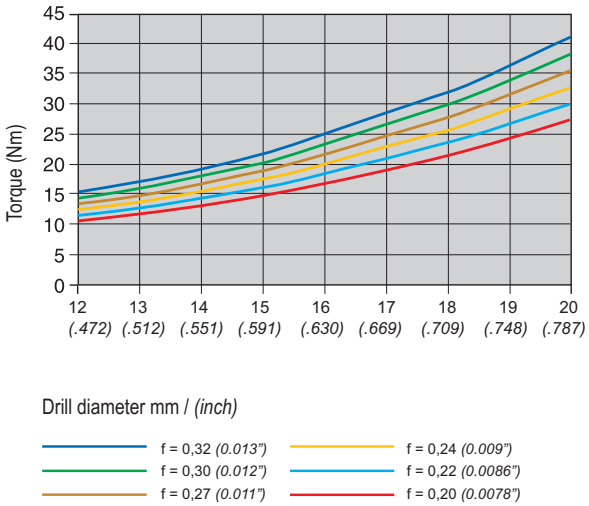


First choice

< 3 x D

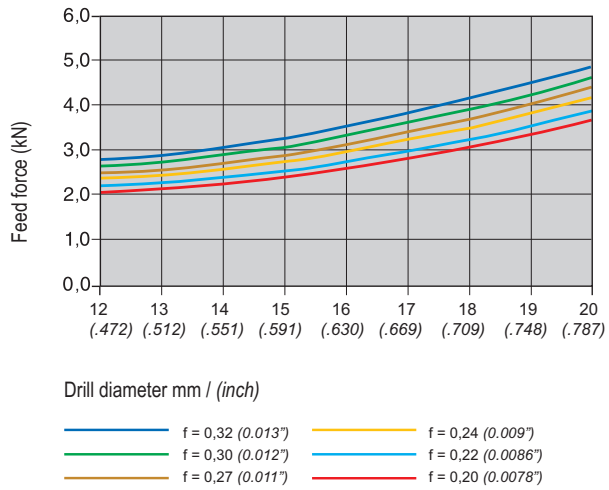


Coolant mix
Recommended emulsion mix 6-8%. When drilling in stainless steels, superalloys and high strength steels a mix of 10% is recommended

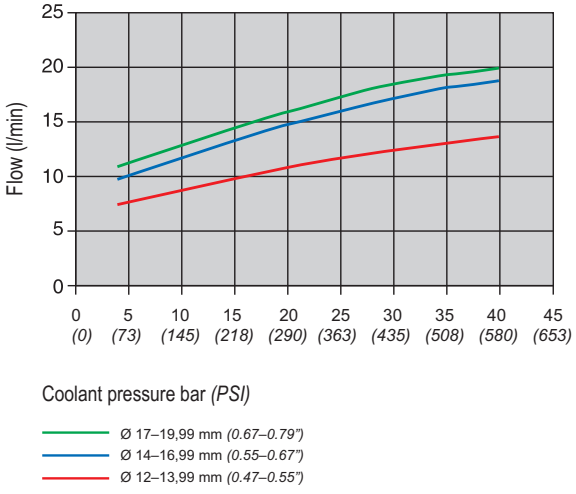


Machining data

The values in the graphs vary with e.g. cutting data, material, efficiency of the machine and tool wear.
The graphs below are valid for Seco Material Group (SMG) P5-P6 and cutting speed 90 m/min *(295 sf/min)*.



Net power consumption



Drilling torque

Feed force

Coolant flow at different pressures

Recommended coolant flow Dx1 l/min
Minimum coolant flow D/2 l/min
D = Drill diameter
Minimum recommended coolant pressure 10 bar *(145 PSI)* with ≤ 3 x D
Minimum recommended coolant pressure 20 bar *(290 PSI)* with ≤ 5 x D
Minimum recommended coolant pressure 40 bar *(580 PSI)* with > 5 x D

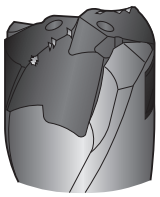
Coolant mix
Recommended emulsion mix is 6–8%.
When drilling in stainless steels, superalloys and high strength steels a mix of 10% is recommended.

Hole tolerances/Surface finish

SD403, SD405 and SD408 IT9-10 / R_a 1-4*, R_a 39-157 µin*					
Drill ∅ DC (mm)	**IT9 tolerance (µm)**	**IT10 tolerance (µm)**	**Drill ∅ DC** *(inch)*	**IT9 tolerance** *(inch)*	**IT10 tolerance** *(inch)*
10-18	0 – +43	0 – +70	*0 – +0.394-0.709*	*0 – +0.0017*	*0 – +0.0028*
18-30	0 – +52	0 – +84	*0 – +0.709-1.181*	*0 – +0.0020*	*0 – +0.0033*

*Deterioration of surface finish and hole tolerance can occur when drilling in low carbon steel or stainless steel. Use the shortest drill possible for best hole quality.

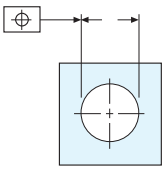
Troubleshooting – Initial check points:



- Fixturing stability
- Machine spindle condition
- Tool holder condition

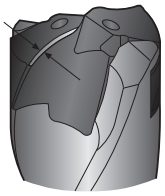
- Clamping of tool:
  - Run-out within 0,06 TIR

- Chip evacuation:
  - Cutting data



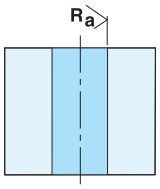
- Coolant:
  - Pressure
  - Flow
  - Concentration

Cutting edges get chipped



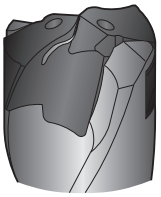
- Reduce the feed/rev
- If the drill vibrates, reduce the cutting speed and increase the feed rate
- When drilling through rough, hard or angled surfaces, reduce the feed rate by 30%-50% during entrance and exit

Unsatisfactory diameter tolerance



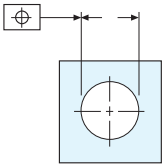
- Increase the feed/rev
- Use a Seco Feedmax solid carbide drill, see page(s) 15-17
- Use a reaming operation, see page(s) 327
- Use a boring operation, see pages(s) 516-517

Too fast flank wear



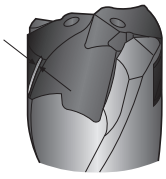
- Check that correct geometry is used
- Reduce the cutting speed

Unsatisfactory surface finish



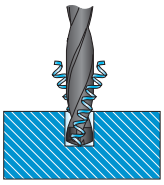
- Reduce the feed/rev
- Increase the cutting speed
- Check that the correct geometry is used
- Use a Seco Feedmax solid carbide drill, see page(s) 15-17
- Use a reaming operation, see page(s) 327

Groove wear



- Reduce the feed /rev
- Reduce the cutting speed
- Increase the coolant concentration

Unsatisfactory positioning of the hole



- Reduce the feed/rev
- If drilling through rough, hard and angled surface - reduce the feed by 30%-50% during entrance and exit
- Pre drill with a 140˚ point angle
- Use a Seco Feedmax solid carbide drill see Feedmax page(s) 15-17
- Use a boring operation, see page(s) 516-517

Wear of peripheral land margins

- Check that the correct geometry is used
- Reduce the cutting speed
- Increase the coolant concentration
- When drilling through rough, hard or angled surfaces, reduce the feed rate by 30-50% during entrance and exit

Chip jamming due to long chips

- Increase the feed
- In long chipping materials SMG P1-P4, SMG M1-M2:
  - Increase cutting speed and reduce feed/rev
  - Use the L geometry

Perfomax®

Perfomax® is a long-standing, proven range of indexable insert drills that offers an economical solution when it comes to productively drilling holes.

- Reliable and trustworthy, square inserts each offer four cutting edges
- Most modern inserts grades and geometries for different workpiece materials
- The drill body design features a unique chip flute design and through coolant holes on all sizes to optimize chip evacuation

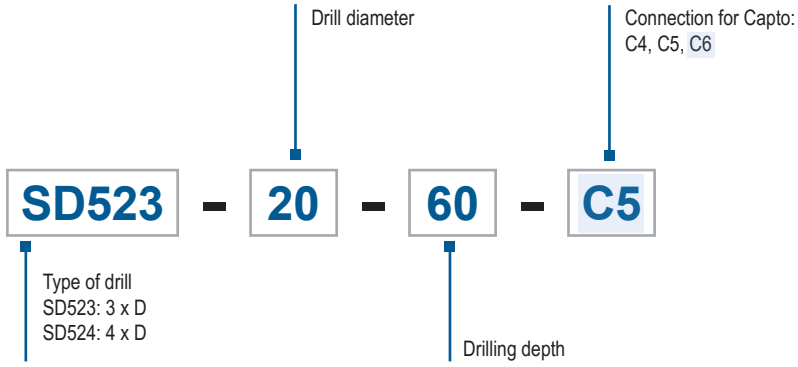
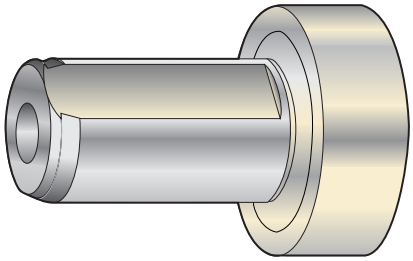
Code keys- Indexable insert drill

Metric



Inch

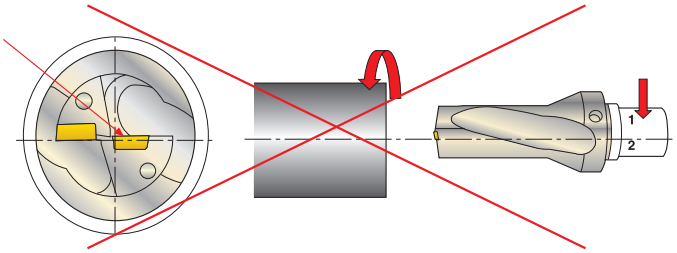


Capto™

Shanks

Shanks

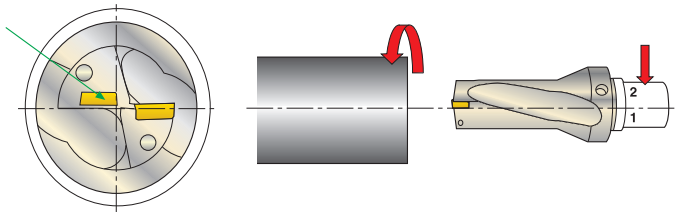
-R7



ISO 9766
Universal choice fits into most holders on the market such as:

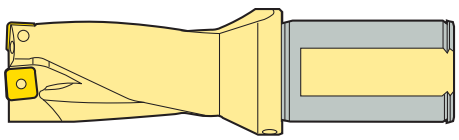
- Weldon 1835B
- ISO 5414
- DIN 69880

Coolant inlet at the back end of the drill.



R7 and R7-C

Shanks with two or four flats
Center insert cutting edge above workpiece center line.

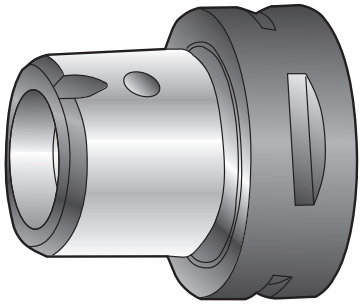


For non rotating applications:

- An additional flat is added to the shank for increased flexibility in lathe applications.
- In such applications the workpiece center line and the drill center line must align.
- If they don't the center insert could be located above the workpiece center line resulting in poor performance of the drill.

By turning the drill 180 degrees the second flat gives the possibility to compensate for this misalignment in a fast and simple way.

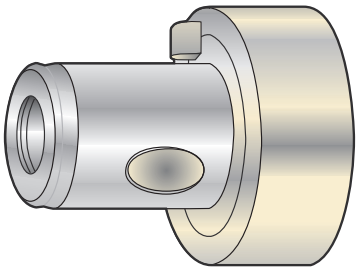
Shanks with four flats
Center insert cutting edge above workpiece center line.



NOTE!

- If a drill with -7 shank is used in a rotating application together with our adjustable holder, the flat located on the same side as the center insert must be used.
- Otherwise the drill diameter will be positioned in the wrong way.

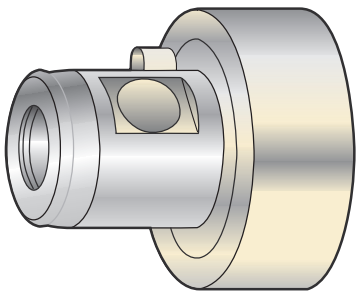
Shanks



Seco-Capto

Seco-Capto C4, C5, C6

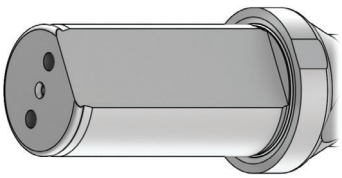
- Flexible - Same tool holder can easily be used in different machines.
- Modular - Possibility to build tools with extension adapters.
- High torque transmission - Torque load is spread symmetrically.
- High rigidity - Tight press fit guarantees that there is no play in the coupling.
- Accurate - Tapered polygon coupling produces a strong, self centering joint within 2 microns.



Graflex

- G

- Fits directly into Graflex holders and locked with two ball headed locking screws placed at 120°.
- Modular assemblies delivering rigidity and good run-out.
- Cylinder/face connection - great accuracy.
- Quick and easy assembling/disassembling of the modules for high flexibility.
- Coolant inlet at the back end of the drill.



ABS 50 (compatible)

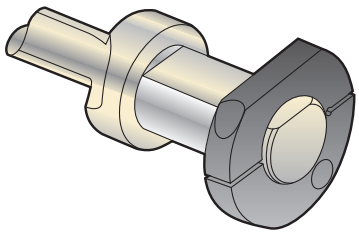
- 2

- An ABS 50 Compatible shank.
- Fits directly into ABS 50 holder with one locking screw.
- Coolant inlet at the back end of the drill.

VDI 30 and VDI 40 (compatible)

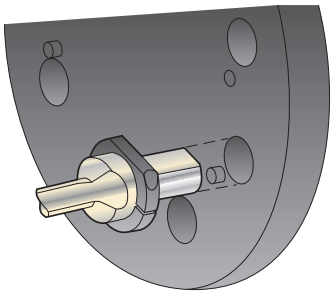
- 8

- VDI compatible shank.
- Fits directly into holders for:
  – VDI 3425 bl.2
  – DIN 69880



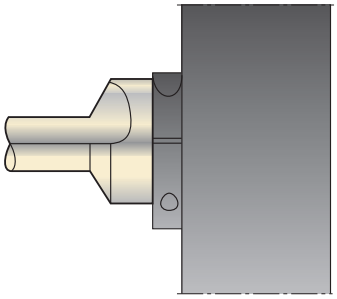
NOTE!
The coolant ring must be ordered separately.

Shanks – Coolant ring

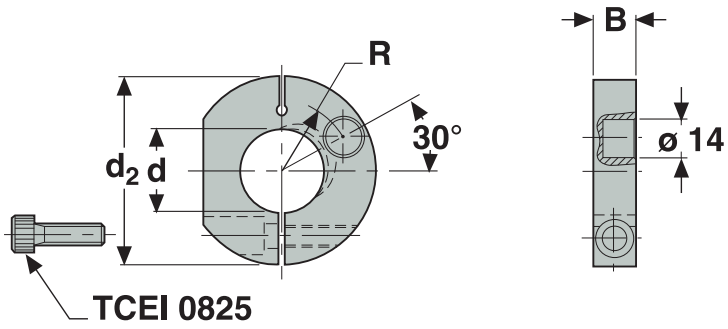


VDI 30			
Drill depth	Drill diameter		Accessories Coolant ring
	mm	*inch*	
2 x D	15-31	*0.591-1.220*	SDA5-30R8
3 x D	15-31	*0.591-1.220*	SDA5-30R8
4 x D	17-31	*0.669-1.220*	SDA5-30R8
5 x D	19-31	*0.748-1.220*	SDA5-30R8

VDI 40					
Drill depth	Drill diameter		Plug	Locking screw	Accessories Coolant ring
	mm	*inch*			
2 x D	15-31	*0.591-1.220*			SDA5-40R8
3 x D	15-31	*0.591-1.220*			SDA5-40R8
4 x D	17-31	*0.669-1.220*			SDA5-40R8
5 x D	19-31	*0.748-1.220*			SDA5-40R8
2 x D	41-59	*1.614-2.323*	R1/4”	P6SS8x8	SDA5-40R8
3 x D	41-59	*1.614-2.323*	R1/4”	P6SS8x8	SDA5-40R8

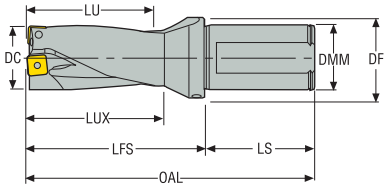


1. Fit the ring around the drill but do not tighten the locking screw.



2. Lock the drill in the collet.

3. Tighten the locking screw in the coolant ring.



Coolant ring

SD522

Drilling depth ~ 2 X D – Metric/Inch

- ISO 9766 shank, -7
- Internal coolant
- For insert information see page(s) 297-303
- For cutting data see page(s) 304, 305
- For intermediate diameters see the MyDesign software.

SD523

Drilling depth ~ 3 x D – Inch

- ISO 9766 shank, R7-C
- Internal coolant
- For insert information see page(s) 297-303
- For cutting data see page(s) 306-307
- For intermediate diameters see the MyDesign software.
- For stationary applications

SD523

Drilling depth ~ 3 x D – Metric/Inch

- ABS 50 compatible shank, -2
- Internal coolant
- For insert information see page(s) 297-303
- For cutting data see page(s) 306-307
- For intermediate diameters see the MyDesign software.

Perfomax® SD602

Seco's Perfomax® SD602 is a modular drill head system specifically designed for deep hole applications that require large diameters drilled safely and efficiently.

- DP3000 grade inserts provide the toughness needed to optimize Perfomax® SD602.
- The grade allows for high feeds and speeds.
- High flexibility by using extensions to reach the required drilling depth.

Code keys

Drilling bodies

Type of drill SD602: Pilot drill and cartridge	Possible drill diameter 89 - Lower diameter 90 - Upper diameter	Flange diameter	Shank type
SD602	89/90	50	RG

Pilot drill

	Drill diameter		Drill diameter	
SD601	1	–	10	– R
	0 = Solid carbide 1 = HSS			Right-hand rotation

(Pilot drill has to be purchased separately)

Cassette

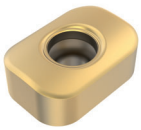
Kit

	Periphery					
SD602	1	–	P	– 07	–	N
	0 = incl 2 pads (< ∅ 135 mm) 1 = incl 4 pads (> ∅ 135 mm)			Insert size SCGX07 SCGX09 SCGX12 SCGX15		N – Nominal diameter U – Lower diameter

-N

-U

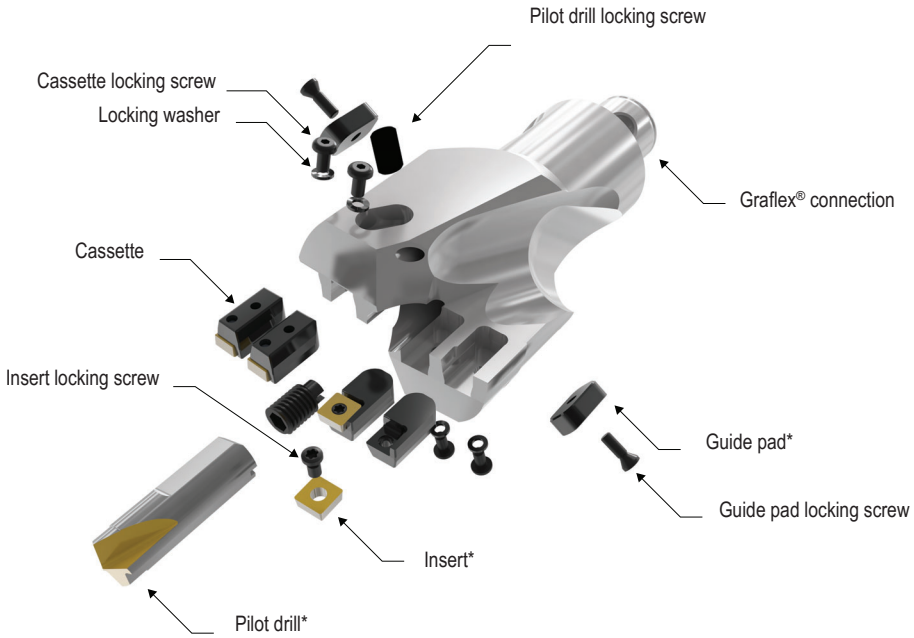


Note: Please select nominal (-N) or lower (-U) diameter spare parts kit “D” on page 291 to complete drill body assembly. Kit “D” must be ordered separately.

Inch

SD602	– 3500	– RG

Pad

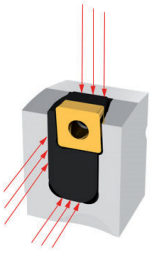


PAD	– L20R25	-N	
			N = Nominal diameter

Modular drill head assembly

SD602-59/60-40RG

Example: Diameter 59; SD602-59-40RG
Use kit: SD6020-P07*



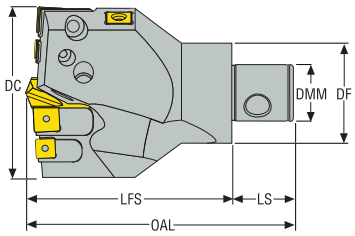
Example: Diameter 60; SD602-60-40RG
Use kit: SD6020-P07-N*

Mounting instruction

- Tighten the cassette locking screw
- Mount the inserts
- Mount the pilot drill and fix it to the bottom of the hole if you need to extend the pilot drill use the adjusting screw
- Mount the extensions

Mounting of cartridge and guide pad

- Mount the cassette
- Make sure that there are no air gaps between the cassette and the walls
- Tighten the cassette locking screw with the torque key:
  SD600-x-07: 3 Nm
  SD600-x-09: 3 Nm
  SD600-x-12: 8 Nm
  SD600-x-15: 8 Nm
- Mount the guide pad
- Tighten the pad locking screw



*** Not included in delivery.** Periph kit, pilot drill and inserts needs to be ordered seperately.

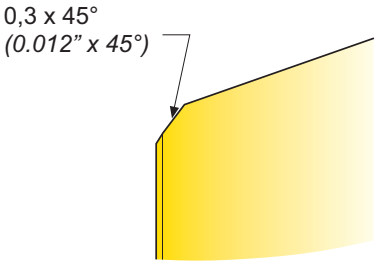
For insert size see page 297-303

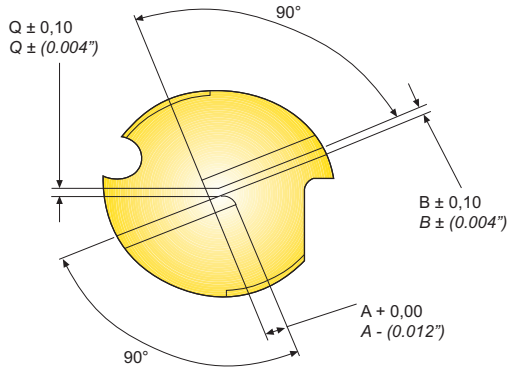
Regrinding instructions for SD602

Specifications:
Proposed specification of diamond wheels:
Conical clearance: Wheel shape12A2 Grit size D54 (picture 1).
Gashing: Wheel shape 1A1 or 1V1 Grit size D64-D46 (picture 2-3).
Corner chamfer: Wheel shape 1A1 or 12A2 (picture 1).
Edge treatment: grinding K-land or brushing (picture 2).



Important:
- The cutting edges must be uniform and have the same size of edge preparation.
- The edge preparation must be applied on the whole length of the cutting edges.

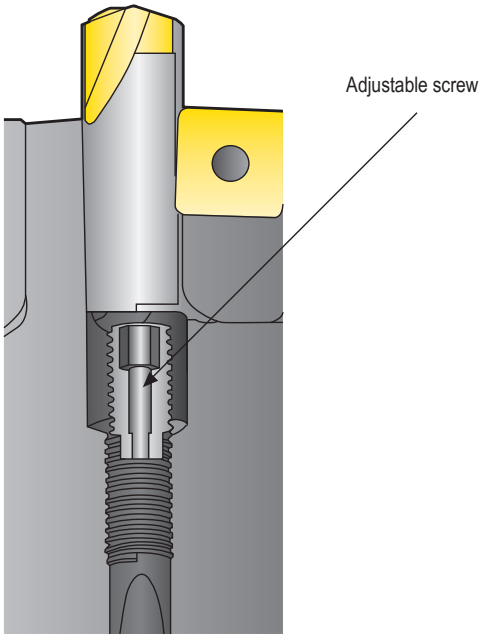
1. **Point angle**



Edge preparation 0-0,1 mm *(0-.004")* x 20°. Drill point conical relief 10°.

2. **Corner chamfer**

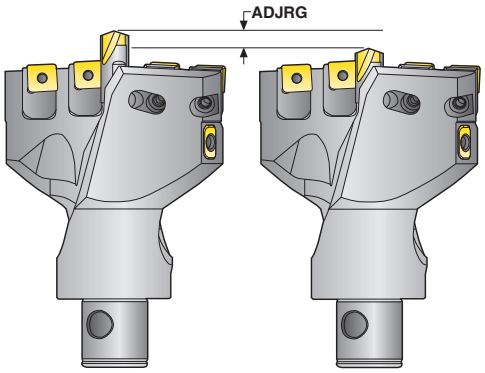
3.



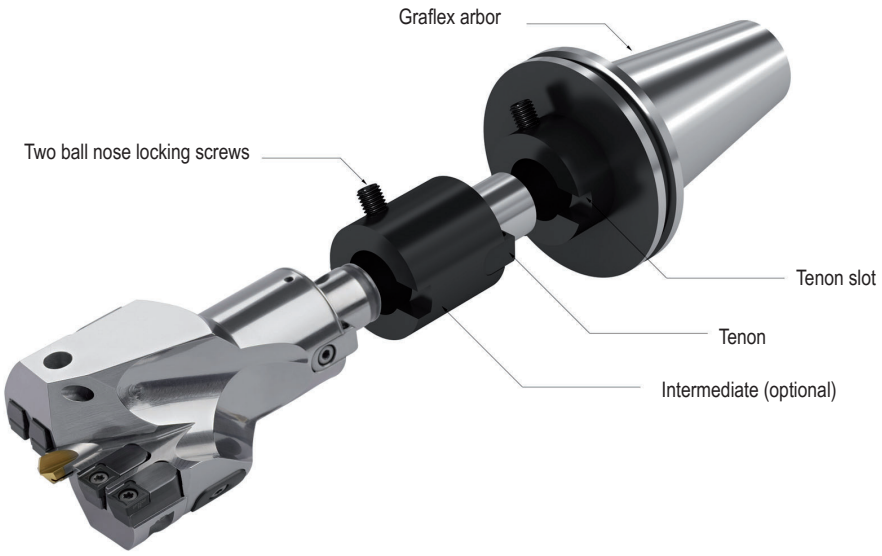
4.

Diameter	Dimensions in mm (*inch*)			
	A	B	C	Minimum length
10 mm	1,5 *(0.059)*	0,5 *(0.020)*	0,57 *(0.022)*	38 *(1.496)*
15 mm	1,5 *(0.059)*	0,6 *(0.024)*	0,68 *(0.027)*	45 *(1.772)*
25 mm	1,5 *(0.059)*	1,4 *(0.055)*	1,6 *(0.063)*	57 *(2.244)*

Modular drill head assembly



Feature: Adjustable pilot drill



Drill	Adjustable length distance ADJRG	
	mm	*inch*
SD602-59/60-40RG	3,0	*0.118*
SD602-69/70-40RG	3,0	*0.118*
SD602-79/80-50RG	5,0	*0.197*
SD602-89/90-50RG	5,0	*0.197*

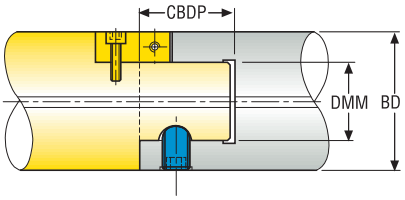
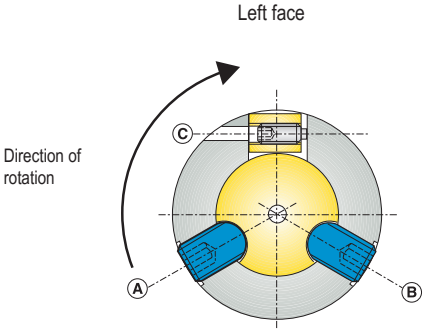
SD602-119/120-63RG	5,0	*0.197*
SD602-139/140-90RG	5,0	*0.197*
SD602-159/160-90RG	5,0	*0.197*
SD602-2500-40RG	3,0	*0.118*
SD602-2750-40RG	3,0	*0.118*
SD602-3000-40RG	5,0	*0.197*
SD602-3250-50RG	5,0	*0.197*
SD602-3500-50RG	5,0	*0.197*
SD602-4000-63RG	5,0	*0.197*

Feature: Adjustable length distance

Benefits: Same setting length after regrinding of pilot drill.
Possibility to adjust the pilot drill overhang.
With drill depths > 5 x D it is recommended to adjust it 5 mm (*0.197*") further out.
Recommendation: In case of re-entering the hole the pilot drill should be adjusted 3 mm (*0.118*") further out from its original position to ensure a better centering.

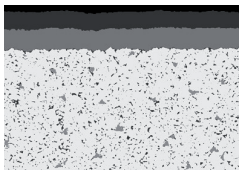


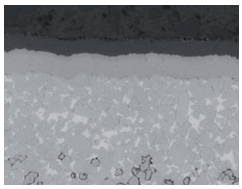


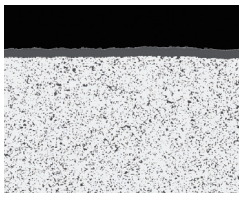
Modular drill head assembly

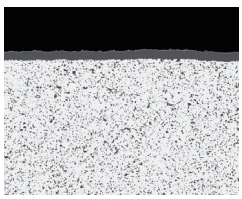
Mounting instruction

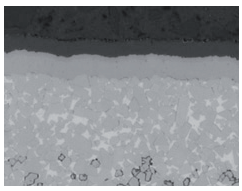
1. Clean the parts to be assembled and apply thin oxidation protection film.
2. Assemble the parts ensuring that the left face of the tenon contacts the left face of the tenon slot.
3. Lightly tighten screw A (drill heads needs to be moved back and forth to find the lowest point for screw A).
4. Lightly tighten screw B.
5. 'Torque' the blocking screw C.
6. 'Torque' screw A.
7. 'Torque' screw B.
8. Double check the blocking screw tightening.

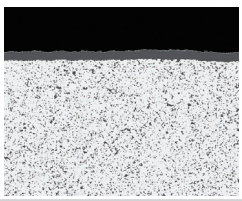






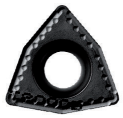


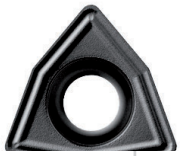




Graflex size	DMM mm (*inch*)	BD mm (*inch*)	CBDP mm (*inch*)	Recommended Graflex connection locking torques	
				Ball nose screws (A) & (B)	Tenon blocking screw (C)
4	22 *(0.866)*	40 *(1.575)*	24 *(0.945)*	20 Nm *(14.7 ft/lbs)*	0.7 Nm *(0.5 ft/lbs)*
5	28 *(1.102)*	50 *(1.969)*	30 *(1.181)*	25 Nm *(18.4 ft/lbs)*	2 Nm *(1.5 ft/lbs)*
6	36 *(1.417)*	63 *(2.480)*	40 *(1.575)*	35 Nm *(25.8 ft/lbs)*	4 Nm *(2.9 ft/lbs)*
7	46 *(1.811)*	90 *(3.543)*	50 *(1.969)*	60 Nm *(44.2 ft/lbs)*	8 Nm *(5.9 ft/lbs)*

Insert grade





Features:
- 4 cutting edges per insert
- Strong square inserts

Benefits:
- Economy
- Reliability
- Performance
- Low cost per hole

Peripheral insert		
DP2000		DURATOMIC® coating technology Optimized grade for steel and cast iron machining For machining with very high cutting speeds A unique combination of superior edge toughness and a thick wear resistant coating Ti(C,N) + Al_2O_3 DURATOMIC®
DP3000		DURATOMIC® coating technology Universal grade Superior wear resistance and edge toughness Tough grade for maximum application security Ti(C,N) + Al_2O_3 DURATOMIC® Gradient substrate
DS2050		Optimized grade for Titanium, super alloys and difficult stainless steel PVD coated TiAlN + NbN
T250D		First choice in hardened steel and in high Si content aluminum Sharp cutting edge through micrograin substrate and pvd coating (TiAl)N + TiN

Center insert		
T400D		First choice Tough center insert grade for maximum application security PVD coated (Ti, Al)N + TiN
DP3000		DURATOMIC® coating technology Universal grade Superior wear resistance and edge toughness Tough grade for maximum application security Ti(C,N) + Al_2O_3 DURATOMIC® Gradient substrate

SMG = Seco material group V_c = m/min (sf/min) All cutting data are start values

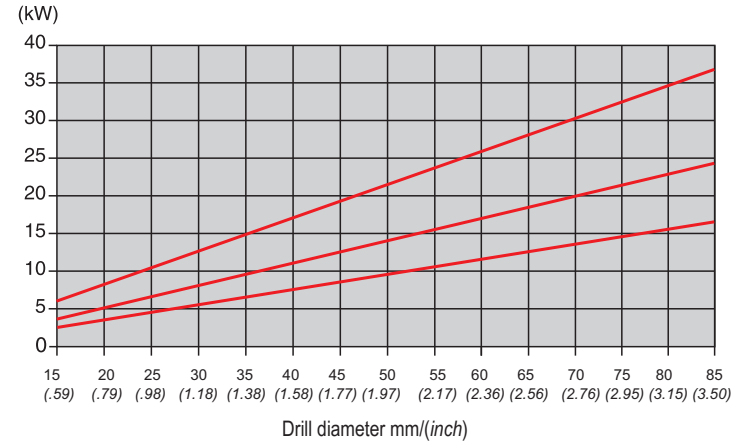
Machining data SD522, SD523, SD524, SD525, SD542 and SD572 - Power consumption, coolant volume requirement and force graphs

The values in the graphs vary with e.g. cutting data, material, efficiency of the machine and tool wear.
The graphs below are valid for Seco Material Group (SMG) P5-P6 and cutting speed 200 m/min (*655 sf/min*).

Feed force

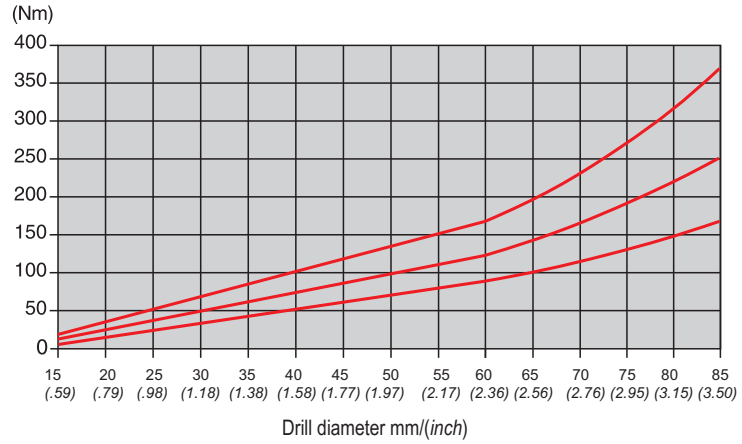


f = 0,18 mm/rev
(f = 0.007 inch/rev)

f = 0,12 mm/rev
(f = 0.005 inch/rev)

f = 0,08 mm/rev
(f = 0.003 inch/rev)

Net power consumption

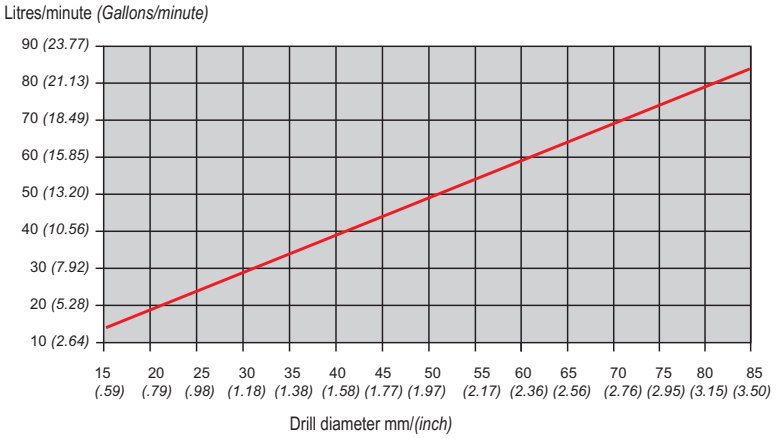


f = 0,18 mm/rev
(f = 0.007 inch/rev)

f = 0,12 mm/rev
(f = 0.005 inch/rev)

f = 0,08 mm/rev
(f = 0.003 inch/rev)

Drilling torque

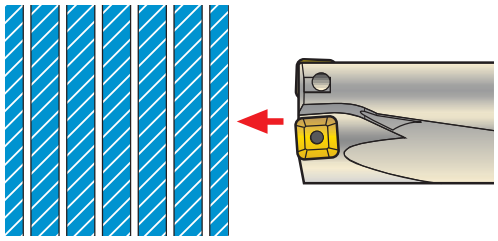


f = 0,18 mm/rev
(f = 0.007 inch/rev)

f = 0,12 mm/rev
(f = 0.005 inch/rev)

f = 0,08 mm/rev
(f = 0.003 inch/rev)

Machining data



Coolant volume requirement

Coolant pressure requirement

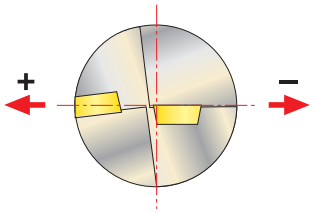
Recommended pressure bar *(PSI)*			
	Drill diameter mm (*inch*)		
Drilling depth	15–25 *(0.591-0.984)*	> 25–40 *> 0.984-1.575*	> 40 *> 1.575*
< 3 x D	6 *(87)*	4,5 *(65)*	3 *(44)*
≥ 3 x D	12 *(174)*	9 *(130)*	6 *(87)*

Drilling of stacked materials

Drilling of stacked materials with no air gaps between the layers, max 0,2 mm *(0.008")*, can be done with SD522 2 x D, SD523 3 x D and the SD542 2.5 x D and the SD542 2.5 x D drill. The component must be securely fixed so no flexing occurs when breaking through each layer.

Cutting data and insert recommendations for drilling of stacked materials

	Insert geometry	Carbide grade
Center insert	SPGX-C1	T400D
Periph insert	SCGX-P2	DP3000



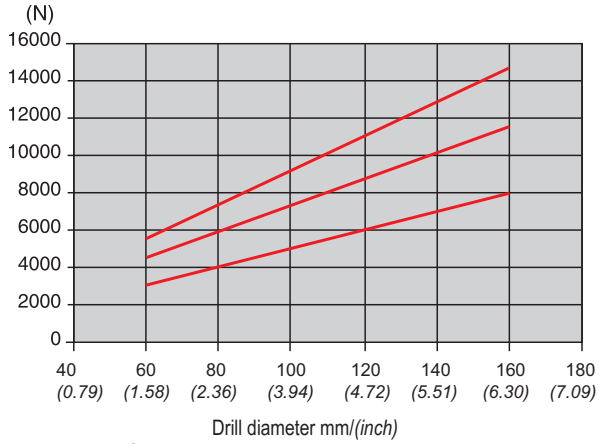
Cutting speed: See recommendations for DP3000 carbide grade
Feed / rev: See recommendations for P2 geometry

If a problem occurs when breaking through each layer, reduce the fed / rev by 30-50 %.

Caution!
The disc produced when the drill breaks through can be ejected at high speed when using the drill as a stationary tool, (rotating workpiece).
It is most important to ensure that the machine is adequately guarded to ensure operator safety.

Set up

Hole diameter adjustment and set-up recommendation
The insert drills can be displaced off-center to achieve a smaller or larger hole diameter than the actual drill.
For measurement see 'Radial adjustment' in the tool data table in the catalogue pages.



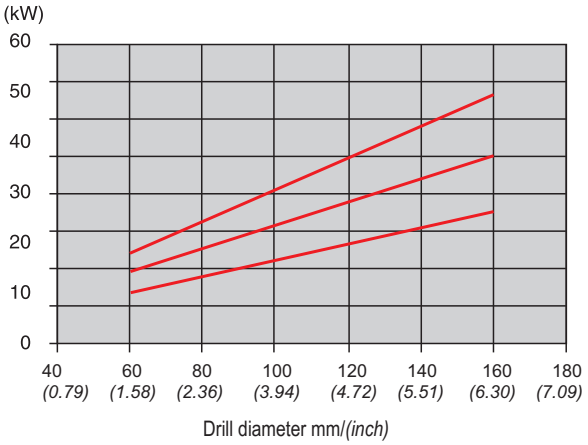
Rotating
Seco's adjustable holder is recommended for precision hole diameter IT10 setting when using SD522 and SD523, 3 x D as rotating drills.

Stationary
When mounting the drill make sure the cutting edges are parallel with the guide ways of the cross slide and that the drill center line and workpiece center line align. To achieve a larger hole diameter, displace the drill so that the periphery insert moves away from the workpiece center line.

Machining data SD602 - Power consumption, coolant volume requirement and force graphs

The values in the graphs vary with e.g., cutting data, material, with a machine efficiency of 80%.
The graphs below are valid for SMG P5-P6 and cutting speed 200 m/min *(655 sf/min)*.

Feed force

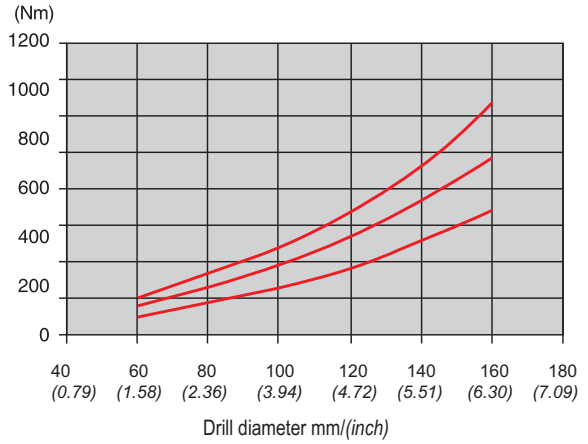


f = 0,18 mm/rev
(f = 0.007 inch/rev)

f = 0,12 mm/rev
(f = 0.005 inch/rev)

f = 0,08 mm/rev
(f = 0.003 inch/rev)

Net power consumption

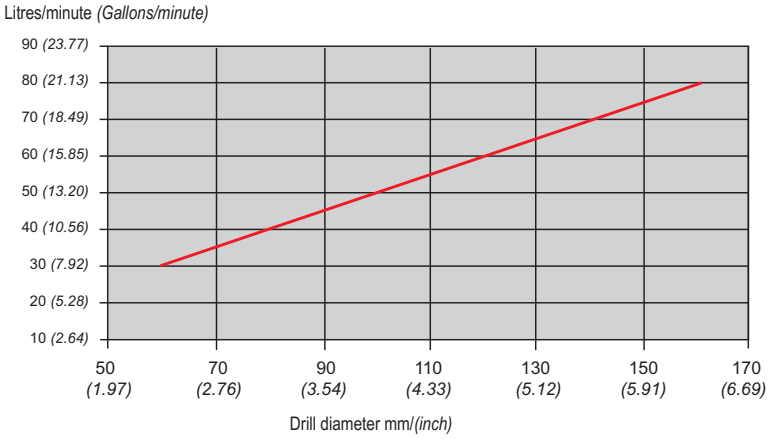


f = 0,18 mm/rev
(f = 0.007 inch/rev)

f = 0,12 mm/rev
(f = 0.005 inch/rev)

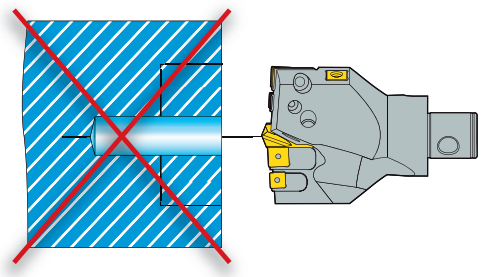
f = 0,08 mm/rev
(f = 0.003 inch/rev)

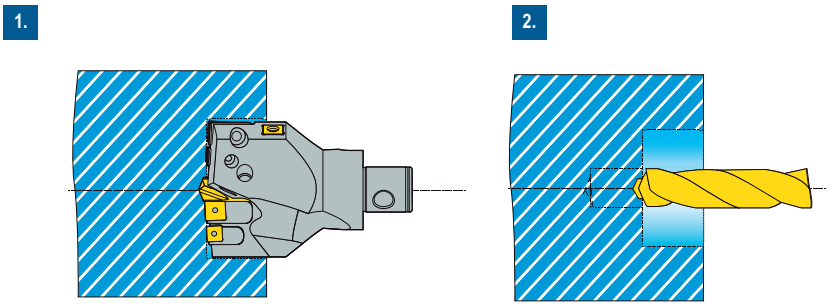
Drilling torque

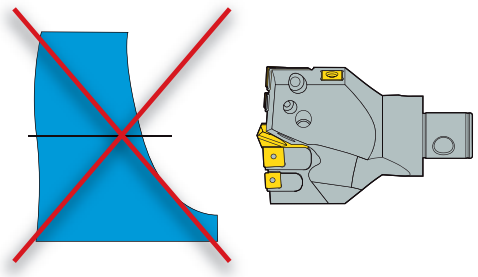


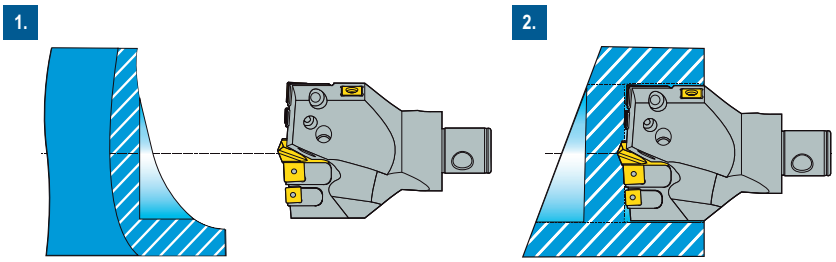
f = 0,18 mm/rev
(f = 0.007 inch/rev)

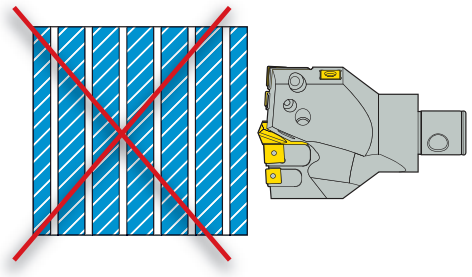
f = 0,12 mm/rev
(f = 0.005 inch/rev)

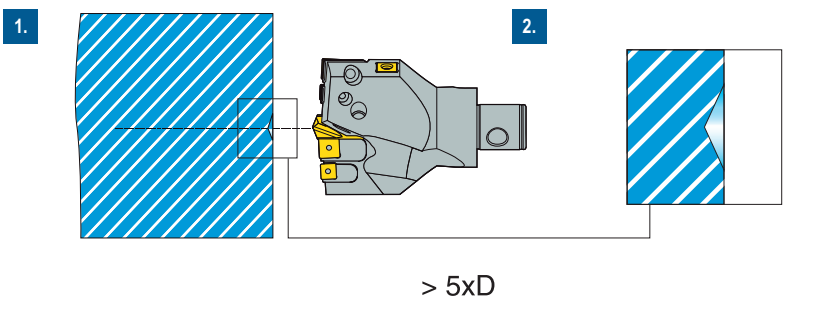












f = 0,08 mm/rev
(f = 0.003 inch/rev)

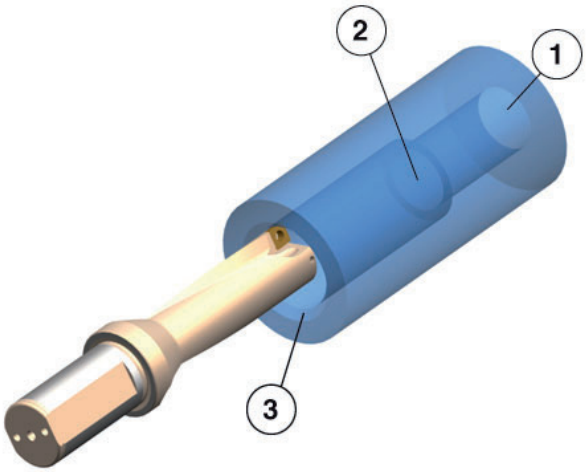
Versatility



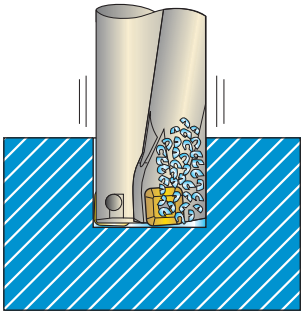
Applications

1. Hole with angled entrance
2. Boring
3. Drilling across an existing hole
4. Drilling and plunging
5. Drilling and milling countersink by circular interpolation
6. Plunging

Multiple choice in non rotating operations

1. Drilling
2. Boring / Conical hole
3. Chamfering

Recommendations



- 2 x D and 3 x D drills (SD522, SD523)
- Reduce the feed ~ 50% when the drill is not fully engaged
- Use grade DP3000
- Use -P2 chipbreaker

Troubleshooting

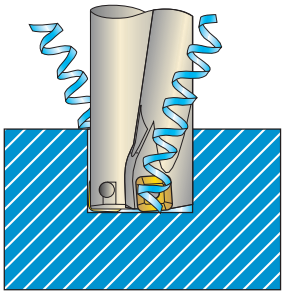
Vibrations

Applications

- Check mounting of drill
- Check mounting of workpiece
- Increase feed. If a very soft material, reduce feed and increase speed
- Reduce the cutting speed

Insufficient torque

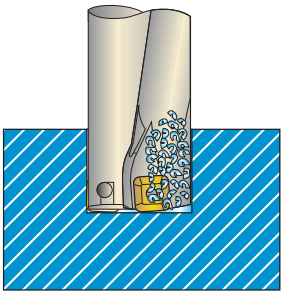
- Reduce feed
- Choose a geometry with harder chipbreaking for lower feeds



Insufficient power

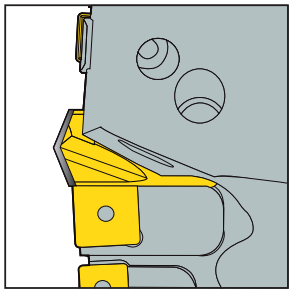
- Reduce cutting speed
- Reduce feed
- Choose a geometry with harder chipbreaking for lower feeds (SCGX-P1)

Chip jamming problems



Chip jamming problems due to long chips

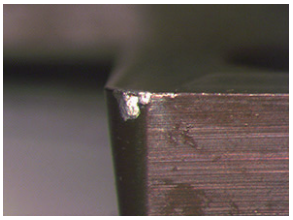
- Increase feed. If a very soft material, reduce feed and increase speed
- Choose a geometry with harder chipbreaking for lower feeds (SCGX-P1)



Chip jamming problems despite short chips

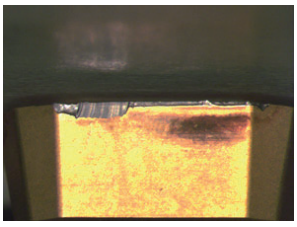
- Increase coolant pressure / volume
- Reduce cutting speed

Rapid flank wear on pilot drill



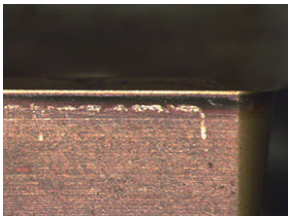
- Reduce the cutting speed
- Increase coolant concentration

Tool life problems



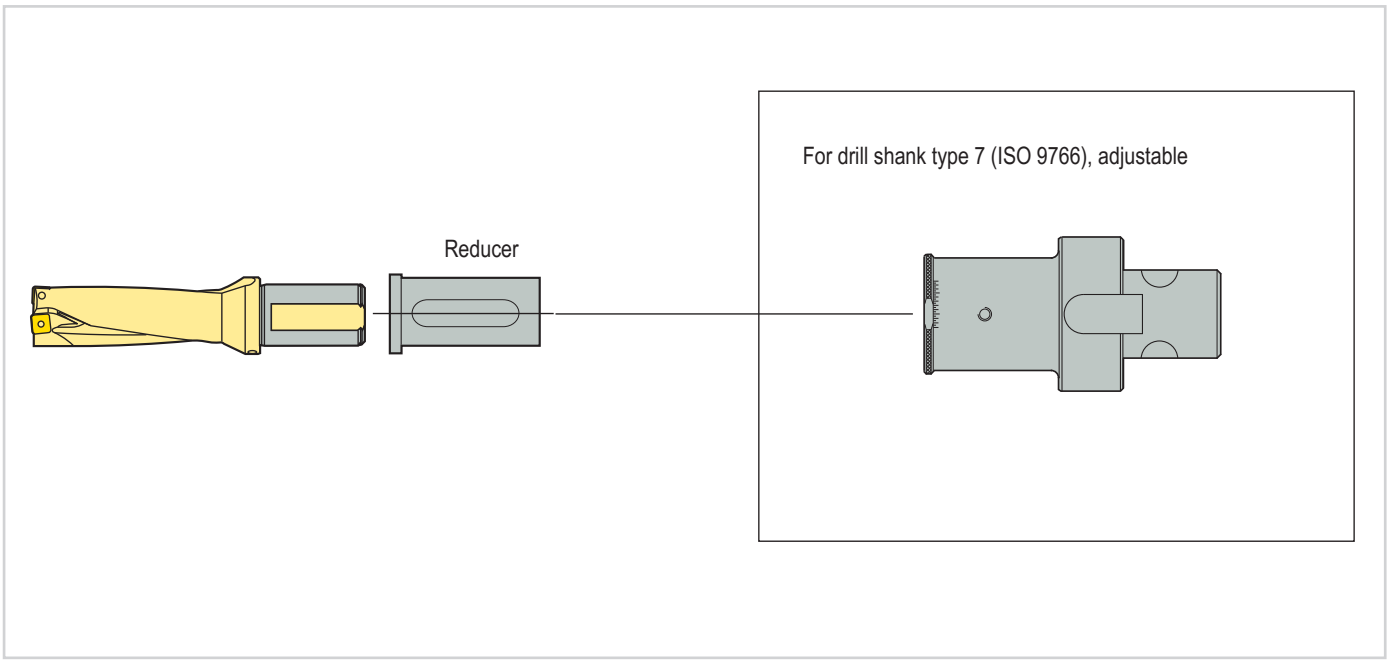
Chipping of periphery insert

- Reduce entrance feed
- Choose a tougher grade
- Choose a geometry with softer chipbreaking for higher feeds (SCGX-P2)
- Reduce feed
- Reduce cutting speed



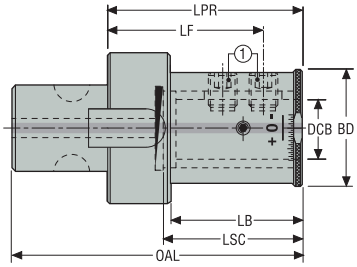
Chipping of center insert

- Check mounting of drill
- Check mounting of workpiece
- Reduce entrance feed
- Increase feed
- Reduce cutting speed



Rapid flank wear on periphery insert

- Reduce cutting speed
- Increase coolant pressure volume
- Choose a more wear resistant grade

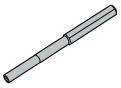


Adjustable holders for drills

ADH 6101 – Adjustable drill holders, for type 7 drill shanks

Graflex®

1. Locking screw



- For Perfomax® drills
- Adjustable from -0,3 mm to +0,8

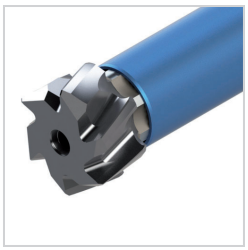
Multi-cut or indexable insert – Choosing the best solution

Quality, performance and tool cost, all these objectives can be met. The choice of a reaming tool depends on hole tolerance, production quantity and cycle time. Seco Holemaking systems can meet these demands.
With Precimaster, Bifix, Xfix and Nanofix reamers Seco can solve all problems related to reaming operations.



The chart below helps you to choose the ideal reaming tool

Bifix®

Precimaster™ Plus

Xfix™

Nanofix™ / Nanojet

Range overview

	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
Precimaster™ Plus  Page(s) 328-367	7,75-60,500 mm *(0.3051-2.3818")*	~ 2-10 x D	IT 6-7-8	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*

Precimaster™ Plus

Precimaster™ Plus is a modular reamer system that boosts reaming speed, stability and versatility for more precise, cost-effective hole production.

- The system features an innovative high-precision connection, solid-carbide disposable heads as well as common holders for blind and through-hole applications
- Enables tolerances held between 15 and 25 microns and surface finishes of R_a 0.4 to R_a 0.8 µm (RMS 15 to 35 micro/inch)

Precimaster™ Plus – Range overview

	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
PMX5 / PMX6 / PMX8 	7,75-60 mm *(0.3051-2.3622")*	~ 2-3 x D	IT 6-7-8	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*
PMX5 / PMX6 / PMX8 	7,75-60 mm *(0.3051-2.3622")*	~ 4-5 x D	IT 6-7-8	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*
PMX5 / PMX6 / PMX8 	7,75-60 mm *(0.3051-2.3622")*	~ 8-10 x D	IT 6-7-8	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*

Code keys

Precimaster Plus toolholders are suitable for both blind and through holes.

Tool shank

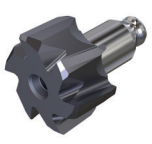
PMX08	–	08200	–	20	–	N	1

- PMX08: Reamer body size
- 08200: Max reaming depth
- N: Neutral
- 20: Cyl. shank diameter
- 1: Type of shank
  1. Cylindrical
  DIN1835

Head

PMX6	–	18H7	–	EB45	–	RX2000

- PMX6: Head type
- 18H7: Hole dia and hole tolerance
- EB45: Entrance geometry
- RX2000: Carbide grade



PMX6

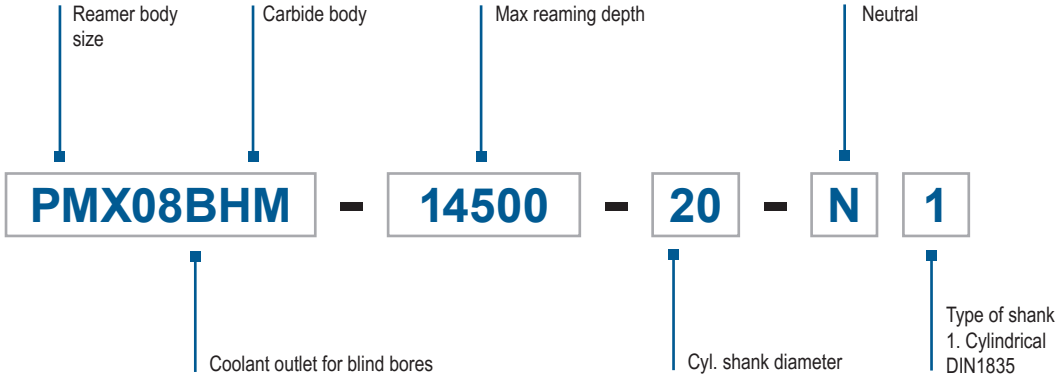
Head intermediate diameter

PMX5	–	15.515 P7 0.6108”/0.6115”	–	EB845	–	RX2000

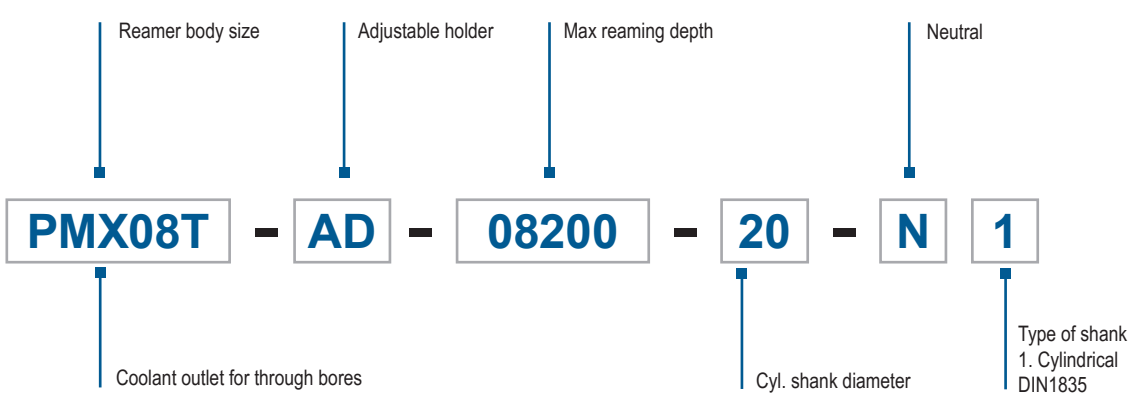
- PMX5: Head type
- 15.515 P7 / 0.6108”/0.6115”: Hole dia and hole tolerance
- EB845: Entrance geometry
- RX2000: Carbide grade

PMX4: RH helical flutes design, suitable for blind bores only.
PMX5: Straight flutes design, suitable for blind and through bores.
PMX6: LH helical flutes design, suitable for through bores only.
PMX8: Straight flutes expandable, suitable for blind and through bores
Left hand flute design improves the action of pushing the chips forward.
Right hand fllute design improves the action of evacuating the chips forward.
See Precimaster Plus head choice page 337.

PMX4

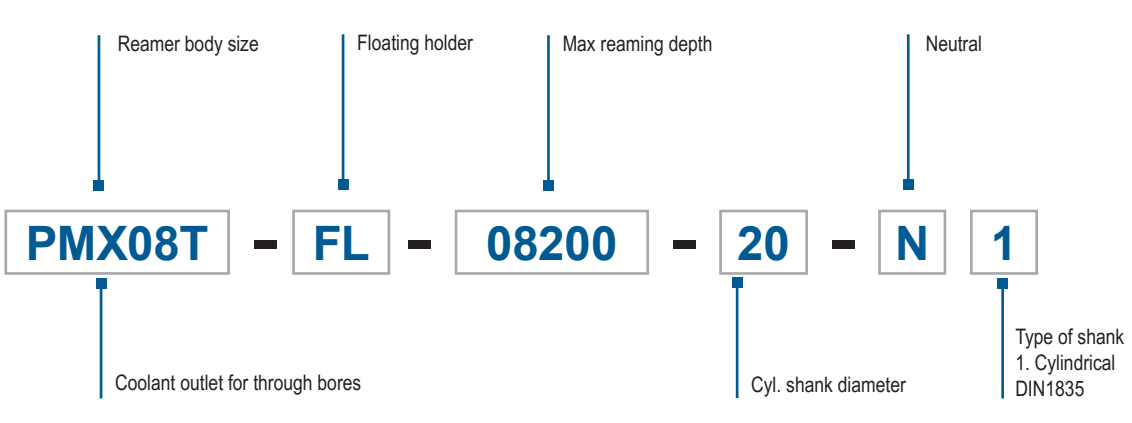


PMX5

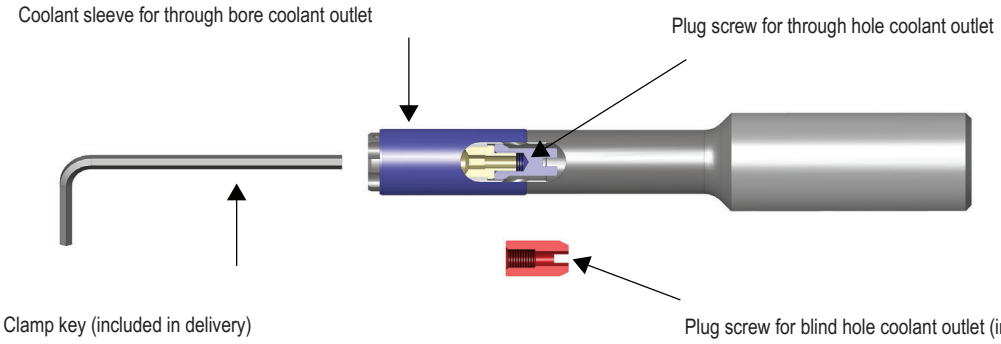


PMX8

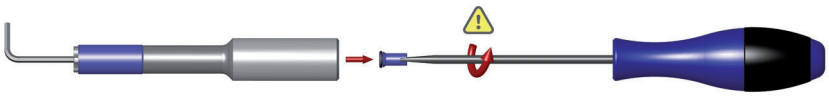
Code keys



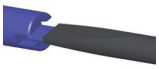
Precimaster Plus toolholders are suitable for both blind and through holes.

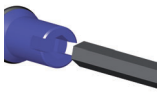


Coolant set-up



Coolant outlet set-up procedure: Spare parts description

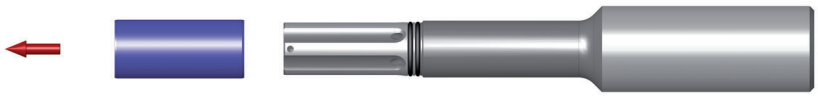




Coolant outlet set-up procedure: Blind bores coolant outlet set-up

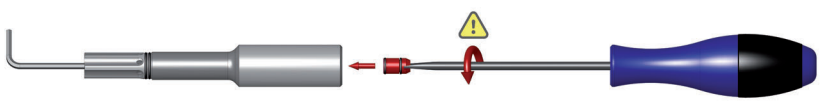
1.

Remove plug screw for through bore (blue)
Note: plug screws are LH screw



Use flat screw driver OR allen key,
recommended hand-tool sizes as per table

Body size	Flat blade screw driver size mm	Flat blade screw driver size *inch*	Allen Key size mm	Allen Key size *inch*
				
PMX05	1,2 x 4 x 120	*0.05 x 0.16 x 4.72*	2 x 120	*0.08 x 4.72*
PMX06	1,0 x 5,5 x 150	*0.04 x 0.22 x 5.9*	2,5 x 150	*0.10 x 5.9*
PMX08	1,2 x 6,5 x 200	*0.05 x 0.26 x 7.87*	3 x 200	*0.12 x 7.87*
PMX12	1,2 x 8 x 200	*0.05 x 0.31 x 6.89*	5 x 200	*0.2 x 6.89*



2.

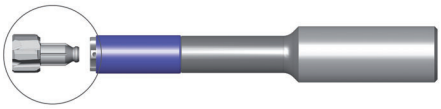
Remove coolant sleeve

3.

Mount plug screw for blind bores (red)
Note: plug screws are LH screw

Head mounting

1.

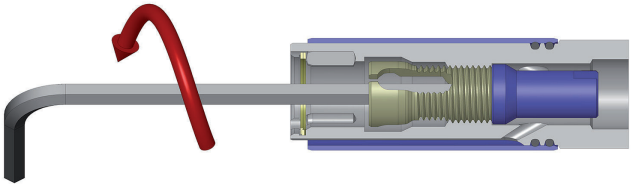


Make sure head geometry is suitable with coolant style

PMX5/PMX8

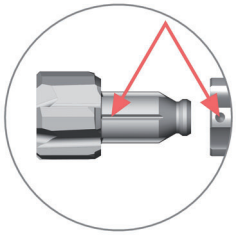
PMX6

Through bores



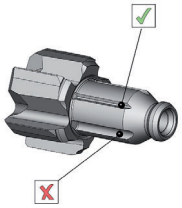
PMX5/PMX8

Blind bores



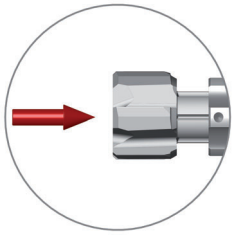
2.

Position clamp before head mounting



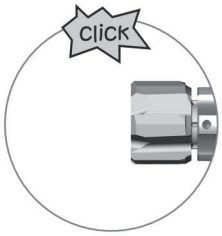
3.

Align index groove with red dot on body



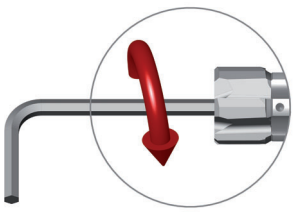
Small Groove

Large Grooves



4.

Place head into body

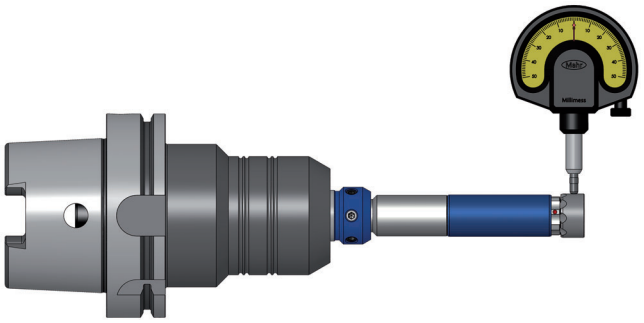


5.

Push head inside body until “click” is achieved

6.

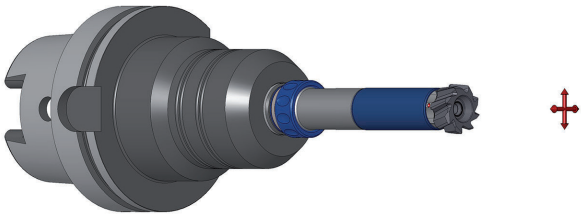
Clamp head using allen key



PMX Shank Size	Recommended clamping torque
PMX05	0,5 Nm
PMX06	0,9 Nm
PMX08	1,2 Nm
PMX12	2,0 Nm
PMX16	5,0 Nm

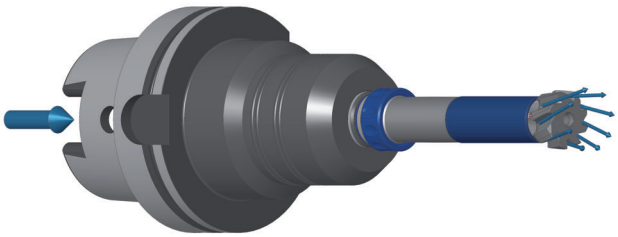
Set up – Run-out

Rotating tool



Max recommended run-out: 10-15 µm *(393.7008-590.5512 µin)*.
Hydraulic chuck , Shrinkfit, holder or precision collet holder is recommended.
For best run-out control, we recommend to use Precimaster Plus PMX-AD adjustable adapters, see page(s) 350-351.

Static tool

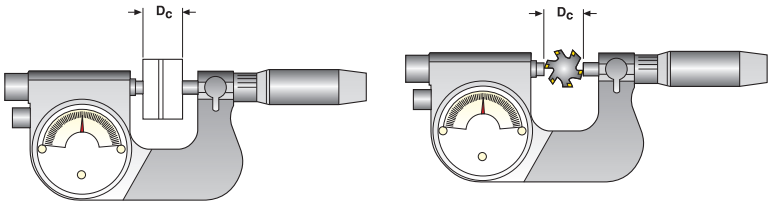


Use Precimaster Plus floating holders PMX - FL, see page(s) 352-353.

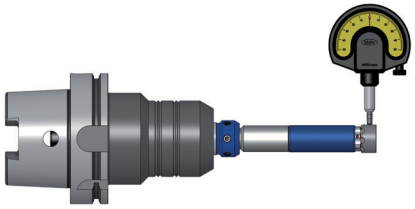
Floating holders allow reamer self-centering in pre-bore.

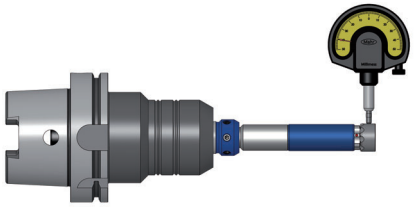
Coolant requirements

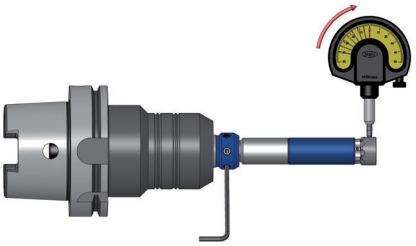
To reach maximum tool life and hole quality, the following coolant requirements should be observed.
Coolant through the tool is recommended.
External coolant supply can be used if reaming depth < 2 x D.
Quality soluble oil with 40 % minimum mineral oil.
Neat oil recommended for stainless steel.
Concentration minimum 6–8 %.
Filtration 30–50 µm *(1200-2000 µin)*.
Volume min 0,5 l/min/mm *(3.35 gal/min/inch)* in tool diameter.
(Ex: Reamer ∅ 10, min volume is 5 l/min *(1.3 gal/min)*.

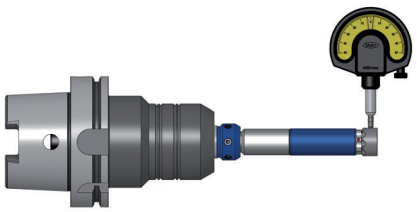


Diameter measurement



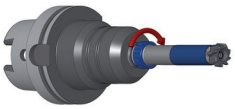


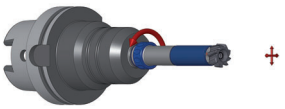


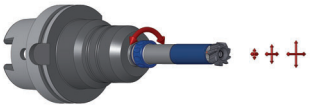


Gauge clock micrometer prior to ∅ measurement.

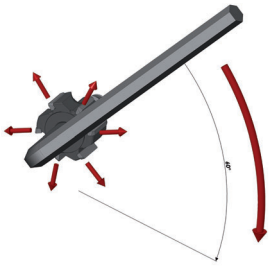
Important
Precimaster reamers have differential pitch between the teeth.
When measuring the diameter, make sure that you have 2 teeth 180° opposite.

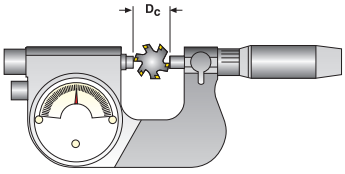






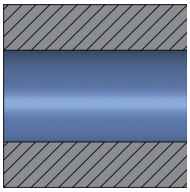
Use clock micrometer and measuring blocks for gauging.

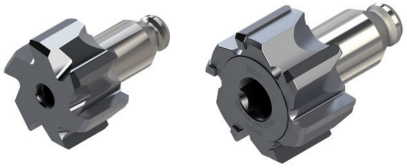


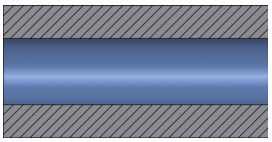


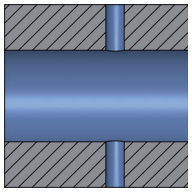
Adjustable shanks set-up:

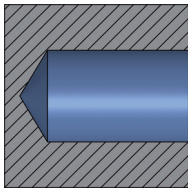
1. Mount setting master (supplied with adjustable holder). Mount tool in the spindle. **2.** Set-up clock as shown.		
3. Rotate tool manually till lowest point is reached.		
4. Proceed to run-out compensation using adjusting screws. Direction as shown with arrows. **5.** Check run-out and repeat compensation if necessary.		
6. When maximum run-out is less than 5 µm *(197 µin)*, secure adjusting screws clamping to avoid loosing adjustment		

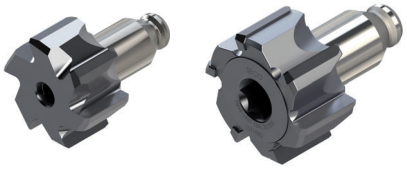


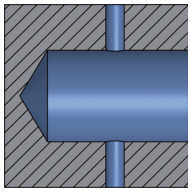


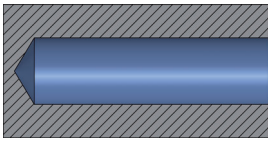


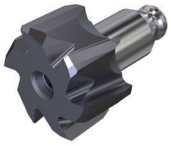






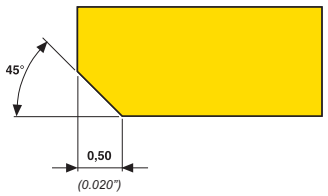




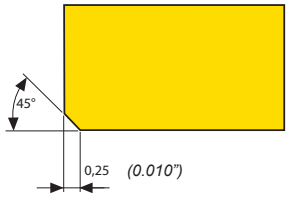


Floating shanks set-up:

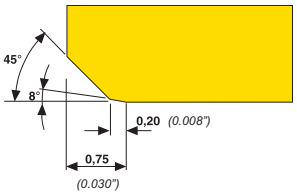
1. Completely lock floating shank turning adjusting ring clockwise.	
2. Open floating shank 2 or 3 clicks turning adjusting ring anti-clockwise.	
3. Proceed to further floating value adjustment if necessary. Too much floating value can create unstable conditions at bore entry. Too few floating value can create vibrations and tapered bore.	



Expandable reamer wear compensation

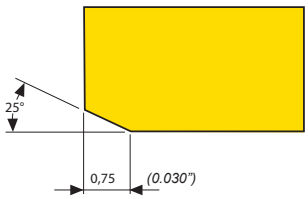


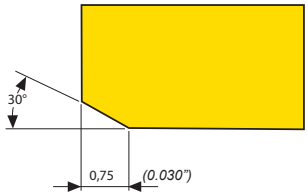
1. Use hexagonal allen key to compensate tool Ø wearing (60° increments = approximately 0.005 µm *(0.197 µin)* compensation on Ø)	
2. Check Ø dimension after expansion using clock micrometer	

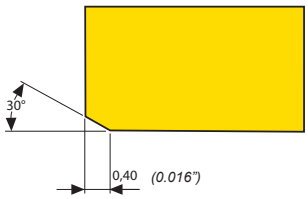


Head choice

Workpiece	Diameter to ream ∅ 8-60 mm *(0.3150-2.3622")*	
Short through hole < 3 x D 	**PMX5 / PMX8** 	
Long through hole > 3 x D 	**PMX6** For through bore application, toolholder coolant outlet must be set for through holes: see coolant set-up pages. 	
Crossing hole 		
Blind hole 	**PMX5 / PMX8** For blind bore application, toolholder coolant outlet must be set for blind holes: see coolant set-up pages 	
Blind and crossing hole 		
Blind hole > 3x D 	**PMX4** For blind bore difficult application, toolholder coolant outlet must be set for blind holes: see coolant set-up pages. 	

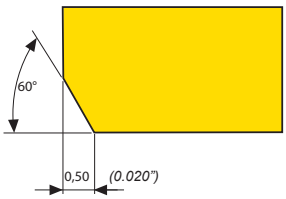






Geometry choice – Applications

Lead geometry - EB45	
Chip control ++ Surface finish+++ R_a 0,8 - 1,2 µm *(Surface finish+++ R_a 31 - 47 µin)* Versatile	



Lead geometry - EBS45	
Chip control +++ Surface Finish + R_a 0,8- 1,2 µm *(Surface Finish + R_a 31- 47 µin)* Short EB45

Grades		
	**RX2000**	**Coated** High performance coated grade suitable for all materials.
	**CP20**	**Coated** A versatile coated grade suitable for most materials, except aluminum. TiN
	**H15**	**Uncoated** A tough micrograin grade for all materials. Suitable for fine-reaming operations due to edge sharpness.
	**CF**	**Cermet** A wear resistant grade for performance optimization in steel.
	**RX1500**	**Coated Cermet** A resistant coated grade for performance optimization in steel and cast iron.
	**RN2010**	**Uncoated** A sub-micrograin uncoated grade with optimized geometries for N-materials (non ferrous).
	**RM2020**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for M materials.
	**RM2090**	**Coated** A wear resistant coated grade with specific geometries for M materials. Optimization in M materials.
	**RK2050**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for K materials.
	**RK1550**	**Coated Cermet** A wear resistant coated grade with specific geometries for K materials. Optimization in K materials.
	**RS2090**	**Coated** A wear resistant coated grade with specific geometries for S materials. Optimization in S materials.

Heads for through and blind holes

∅ 8-32 mm / *0.315-1.260”*

- For choice of geometry, please see page(s) 338-341
- For cutting data see page(s) 360-367

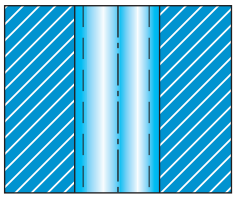
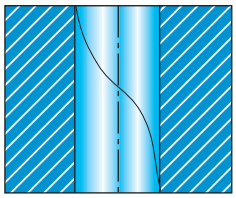
Troubleshooting



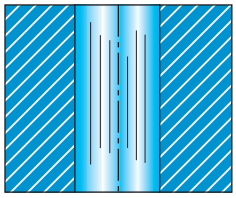
Poor surface finish

- Check material allowance
- Improve coolant conditions (outlet type, pressure, quality)
- Reduce feed rate



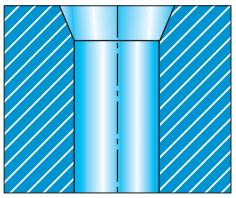
Too large diameter

- Improve centering (part/tool)



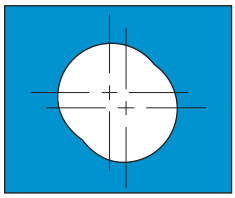
Retraction marks

- Improve coolant conditions (outlet type, pressure, quality)
- Improve centering (part/tool)
- Reduce feed-out speed



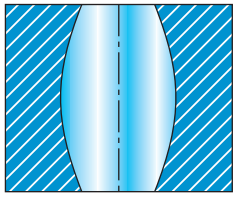
Facets

- Improve centering (part/tool)
- Check material allowance



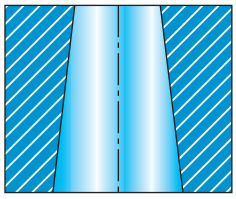
Tapered entry

- Reduce feed rate
- Improve centering (part/tool)
- Reduce radial run-out



Off center/Ovality

- Improve clamping (workpiece deformation)
- Check material allowance
- Improve centering (part/tool

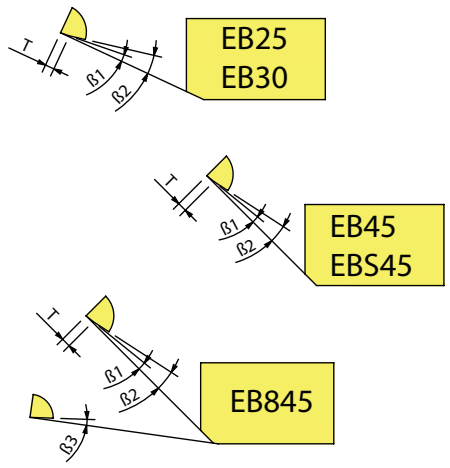


Deformed hole

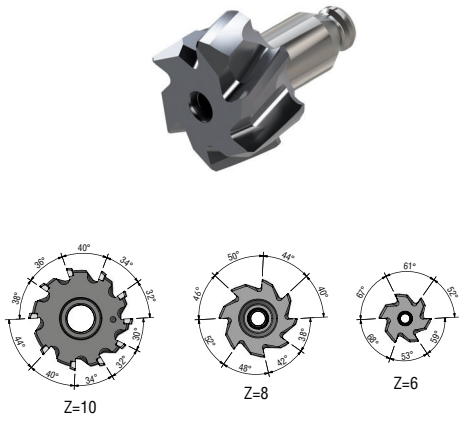
- Improve clamping (workpiece deformation)

Tapered hole

- Improve centering (part/tool)



Regrinding instructions



Specifications

Diamond grinding wheel
Grain size:
D6 – For first clearance angle (β1–β3)
D64 – For second clearance angle (β2)

Important:

Regrinding reduces reamer diameter
Recoating may produce oversized diameter
Max run-out on lead chamfers 10 µm *(394 µin)*

∅ **Precimaster Plus mm** *(inch)*	β_1	β_2	β_3	**T mm** *(inch)*
7,75–9,999 *(0.3151–0.3937)*	8°	18°	8°	0,20 *(0.008)*

Nanofix™

Nanofix™ Solid Carbide Reamers are designed for small diameters from 2.97 to 12.05 mm (.117” - .474”).

- Internal coolant with simple adjustable system so the outlet style can be set for either through or blind bore, depending on application
- Enables tolerances held between 10 and 15 µm (.0004-.0006”)
- Eight available geometries: EB45, EBS45, EB845, EB25, EB30, EBS30, EB60 and EB75

Range overview

	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
Nanofix™ 	2,97-12,05 mm *(0.1169-0.4744")*	5-12 x D	IT 7	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*

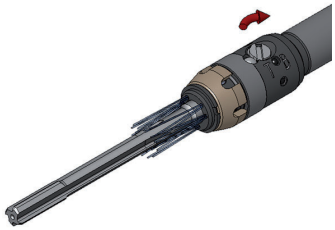
Nanofix™ is a Seco solid carbide reamer programme dedicated for small ∅ from 2,97 to 12,05 mm *(0.1169 to 0.4744")*.
Design includes a unique patented Quick-fit clamping system that will allow it to hold the entire diameter range with only 2 tool holders .
Tool holders have internal coolant with a simple adjustable system so the outlet style can be set for either through or blind bore, depending on application.

Quick-fit

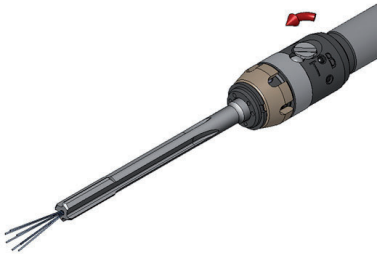
Quick-fit

Quick and easy tool change.
Accurate repositioning in run-out and length.

2 Quick-fit sizes to cover the complete diameter range



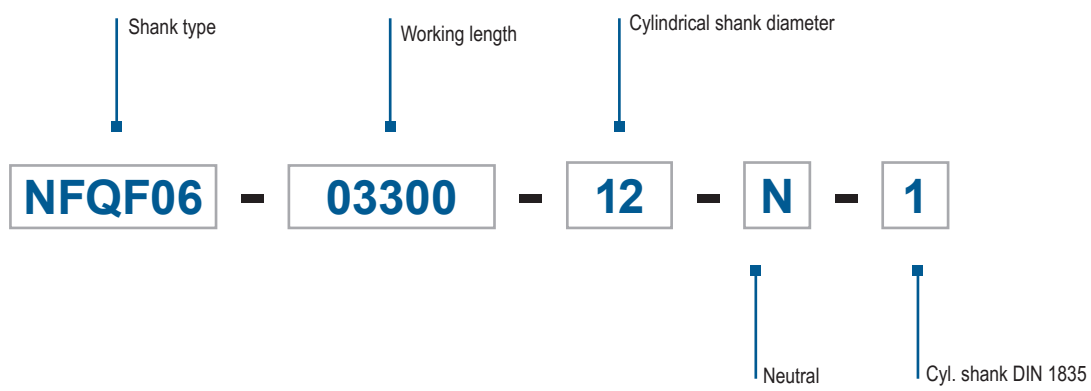
Quick-fit ∅ 10 mm for
∅ 6,051-12,050 mm
(∅ 0.2382-0.4744")



Quick-fit ∅ 6 mm for
∅ 2,97-6,050 mm
(∅ 0.1169-0.2382")

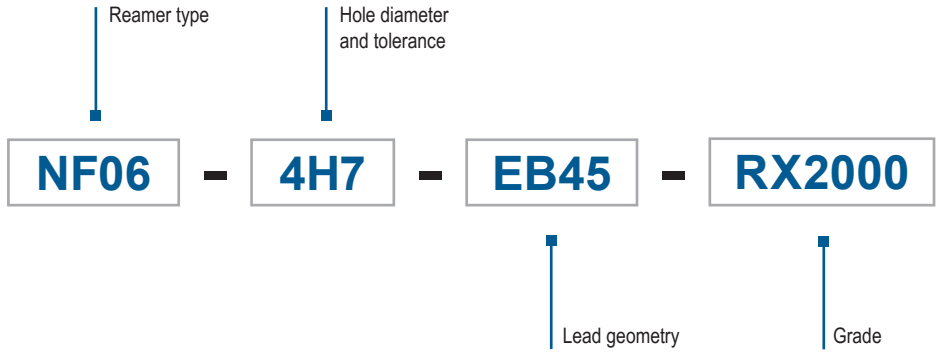
Same tool for blind or through hole application

through



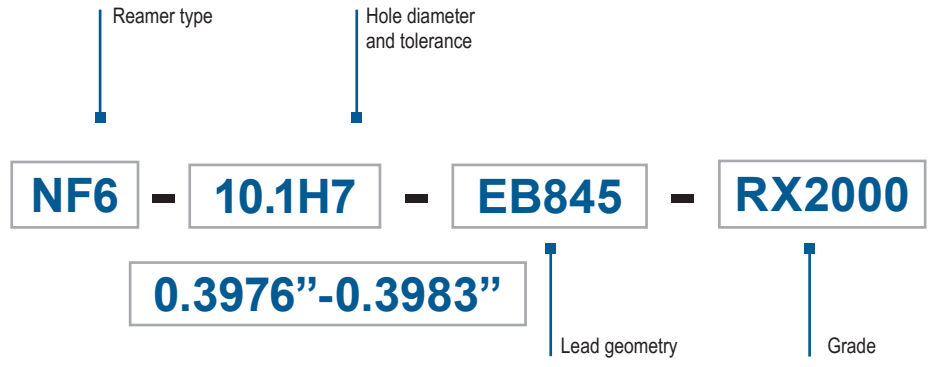
Turn coolant style adjusting screw by 1/4 of a revolution to change coolant outlet from through to blind and vice-versa.

blind



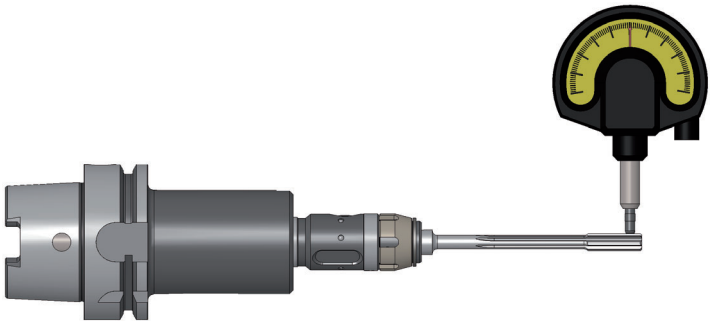
Code keys

Shanks



Reamers

Intermediate diameter reamers

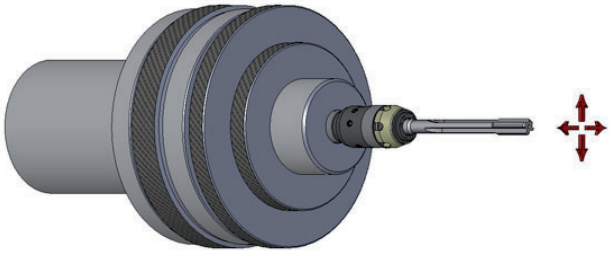


NF06/NF10/NS06/NS10: straight flutes design, suitable for through and blind holes.
NF4/NS4: RH helical flutes design, suitable for blind bores only.
NF6/NS6: LH helical flutes design, suitable for through bores only.
Left hand flute design improves the action of pushing the chips forward.
Right hand flute design improves the action of evacuating the chips backward.
See Nanofix flutes geometries choice on page(s) 373.

Run-out

Rotating tool

Max. run-out recommended: 5 µm *(197 µin)*.
Precision holder is recommended : Hydraulic chuck, D-type collet chuck or 5672 collet chuck.

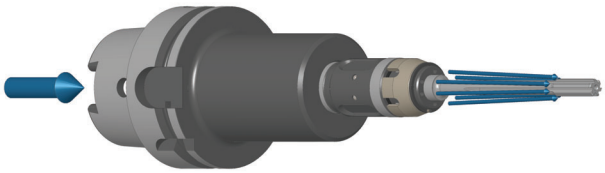


Note: due to coolant outlet adjustment sealing o-ring, the use of a Shrinkfit holder is not recommended.

Static tool

Use a Seco floating holder, see page 505-509.

Floating holders allow reamer self-centering in pre-bore.



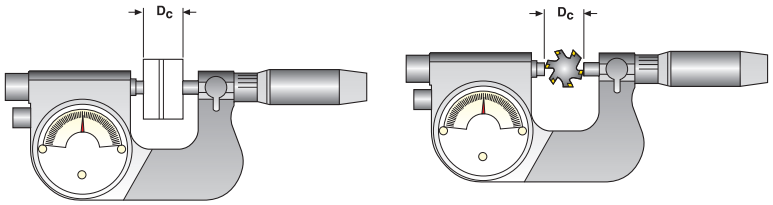
Coolant requirements

To reach maximum tool life and hole quality, the following coolant requirements should be observed.

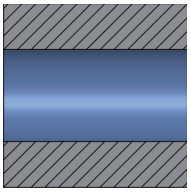
Coolant through the tool is recommended.
External coolant supply can be used with cutting condition reduced by 75%.

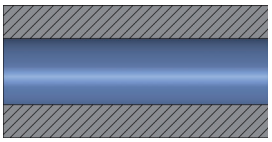
Soluble oil with 40% minimum mineral oil.
Neat oil recommended for stainless steel.

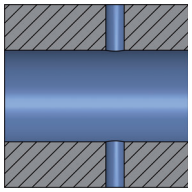
Concentration minimum 6–8%.
Filtration 30–50 µm *(1181-1969 µin)*.
Volume min 0,5 l/min/mm *(0.13 gal/min/inch)* in tool diameter
(Ex: Reamer ∅10, min volume is 5 l/min *(1.3 gal/min)*.

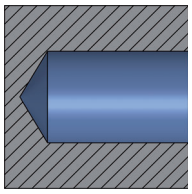


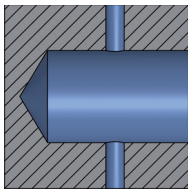
Diameter measurement

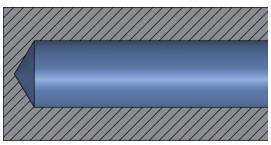








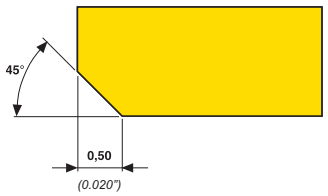




Gauge clock micrometer prior to ∅ measurement.

Important!
Nanofix reamers have differential pitch on teeth.
When measuring the diameter, make sure that you have 2 teeth 180° opposite.

Use clock micrometer and measuring blocks for gauging.



Flute geometry choice

Workpiece	Diameter to ream ∅ 2,97-12,50 mm *(0.1169-0.4744")*	
Short through hole < 3 x D 	**Straight flutes** NF06 NS06 NF10 NS10	
Long through hole > 3 x D 	**LH helical flutes** NF6 NS6	
Crossing hole 		
Blind hole 	**Straight flutes** NF06 NS06 NF10 NS10	
Blind and crossing hole 		
Blind hole > 3x D 	**RH helical flutes** NF4 NS4

Grades		
	**RX2000**	**Coated** High performance coated grade suitable for all materials.
	**CP20**	**Coated** A versatile coated grade suitable for most materials, except aluminum. TiN
	**H15**	**Uncoated** A tough micrograin grade for all materials. Suitable for fine-reaming operations due to edge sharpness.
	**RN2010**	**Uncoated** A sub-micrograin uncoated grade with optimized geometries for N-materials (non ferrous).
	**RM2020**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for M materials.
	**RM2090**	**Coated** A wear resistant coated grade with specific geometries for M materials. Optimization in M materials.
	**RK2050**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for K materials.
	**RS2090**	**Coated** A wear resistant coated grade with specific geometries for S materials. Optimization in S materials.

Spare Parts, included in delivery

DC	Spare Clamping Kit	Key
		
2,97-6,050	NF06-CLKI	CLC06KEY
6,051-12,050	NF10-CLKI	CLC10KEY

Spare clamping kit for Nanofix holders includes:
- 1 clamping nut
- 1 axial stop spring ring
- 3 clamping balls (dia 3,5 mm for size NF06 & dia 5 mm for size NF10)
- 1 fool-proof ball (dia 3 mm for size NF06 & dia 4 mm for size NF10)
- 1 o-ring

Note: fool-proof ball not shown on above view.

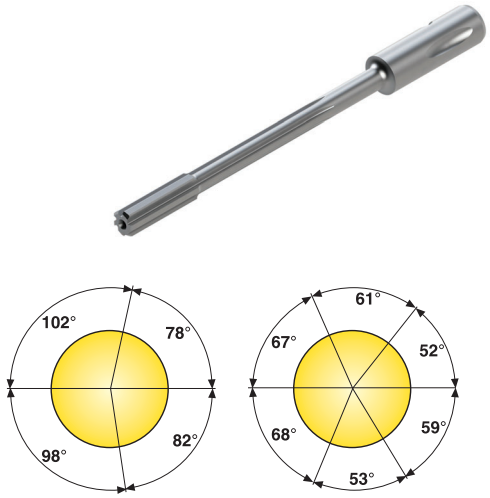
Regrinding instructions



Specifications

Diamond grinding wheel
Grain size:
D6 for 1st clearance angle (β1 - β3)
D64 for 2nd clearance angle (β2)

Important

Regrinding reduces reamer diameter.
Recoating may produce oversized diameter.
Max run-out on lead chamfers 10 µm *(394 µin)*.

Nanofix ∅ mm *(inch)*	β_1	β_2	β_3	T mm *(inch)*
2,97-9,99 *(0.117-0.393)*	8°	18°	8°	0,15 *(0.006)*
10,00-12,050 *(0.394-0.474)*	8°	18°	8°	0,20 *(0.008)*

Nanojet

Nanojet solid carbide reamers are designed for small diameters from 1,461 to 9,960 mm (.057” - .392”).

- Powerful innovative coolant outlet
- Enables tolerances held between 10 and 15 µm (.0004” - .0006”)
- Eight available geometries: EB45, EBS45, EB845, EB25, EB30, EBS30, EB60 and EB75

Range overview

	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
Nanojet 	1,461-9,960 mm *(0.057-0.392")*	~ 4-7 x D	IT 7	Yes, available through My Design	R_a 0,2-1,2 µm *(R_a 7.87-47.2 µin)*

Nanojet is a solid carbide reamer dedicated for small diameters from 1,461 to 9,960 mm (.057" - .392).
Design includes an innovative peripherical coolant outlet delivering coolant diretly into the flutes in an optimized and powerful manner.

Code keys

Reamers

Reamer type | Hole diameter and tolerance

N5TS – **4H7** – **EB45** – **RX2000**

Lead geometry | Grade

Intermediate diameter reamers

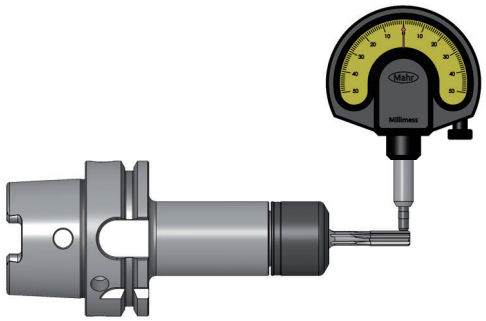
Reamer type | Hole diameter and tolerance

N5BS – **2.5 P7** – **EB30** – **RK2050**

0.0984”-0.0989”

Lead geometry | Grade

N5TS: straight flutes design, suitable for through holes.
N5BS: straight flutes design, suitable for blind holes.

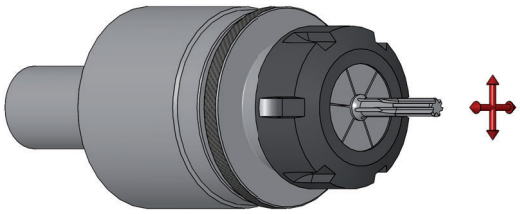


See Nanojet flutes geometries choice on page(s) 406.

Run-out

Rotating tool

Max. run-out recommended: 5 µm *(197 µin)*.
Precision holder is recommended : Hydraulic chuck, D-type collet chuck or 5672 collet chuck.

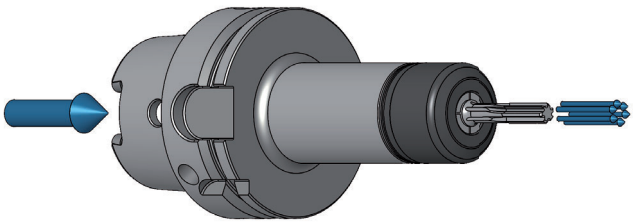


Note: due to coolant outlet adjustment sealing o-ring, the use of a Shrinkfit holder is not recommended.

Static tool

Use a Seco floating holder, see page 505-509.

Floating holders allow reamer self-centering in pre-bore.



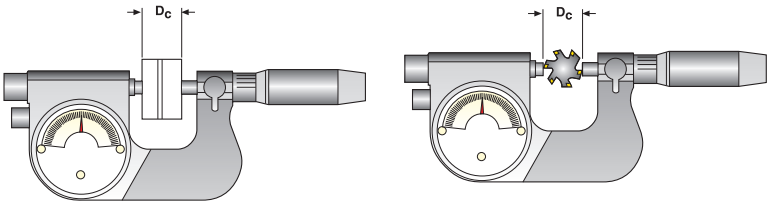
Coolant requirements

To reach maximum tool life and hole quality, the following coolant requirements should be observed.

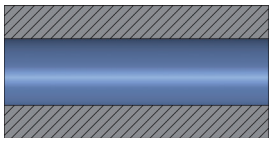
Coolant through the tool is recommended.
External coolant supply can be used with cutting condition reduced by 75%.

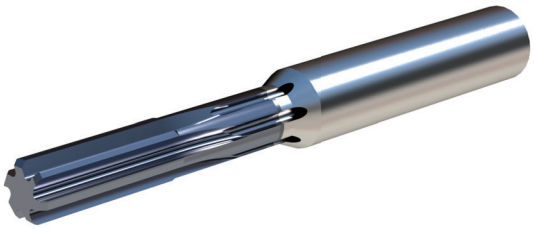
Soluble oil with 40% minimum mineral oil.
Neat oil recommended for stainless steel.

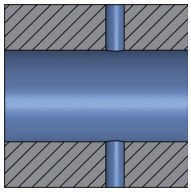
Concentration minimum 6–8%.
Filtration 30–50 µm *(1181-1969 µin)*.
Volume min 0,5 l/min/mm *(0.13 gal/min/inch)* in tool diameter
(Ex: Reamer ∅10, min volume is 5 l/min *(1.3 gal/min)*.

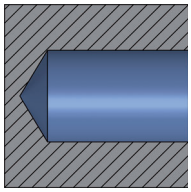


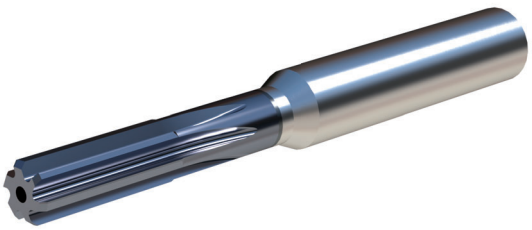
Diameter measurement

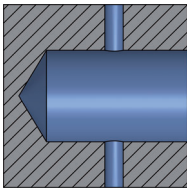


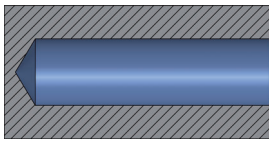


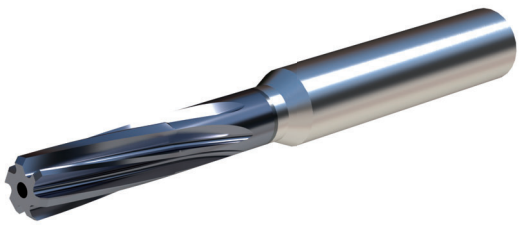






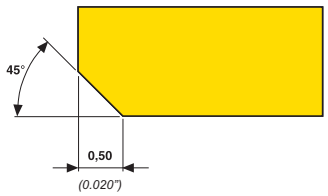


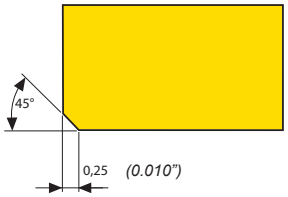


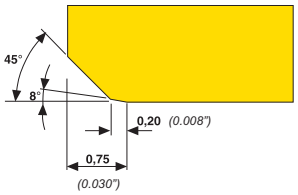


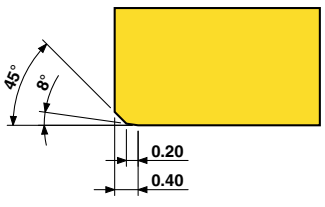
Gauge clock micrometer prior to ∅ measurement.

Important!
Nanojet reamers have differential pitch on teeth.
When measuring the diameter, make sure that you have 2 teeth 180° opposite.



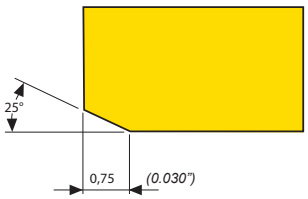


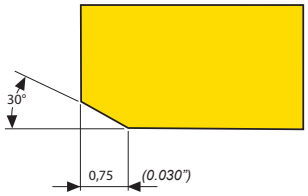


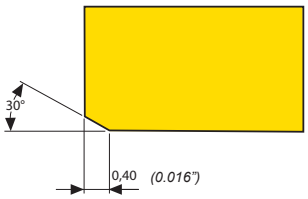


Use clock micrometer and measuring blocks for gauging.

Flute geometry choice



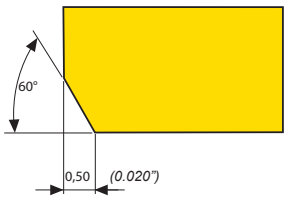


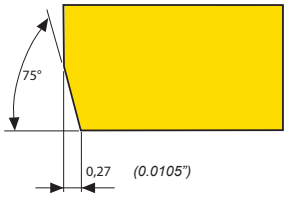


Workpiece	Diameter to ream ∅ 1,461-9,960 mm *(0.057-0.392")*	
Through holes 	**Straight flutes** N5T	
Through and crossing holes 		
Blind hole 	**Straight flutes** N5B	
Blind and crossing hole 		
Blind hole > 3 x D 	**RH helical flutes** N4B	

Geometry choice – Applications

Lead geometry - EB45	
Chip control ++ Surface finish+++ R_a 0,8 - 1,2 µm *(Surface finish+++ R_a 31 - 47 µin)* Versatile	
Lead geometry - EBS45	
Chip control +++ Surface Finish + R_a 0,8- 1,2 µm *(Surface Finish + R_a 31- 47 µin)* Short EB45	
Lead geometry - EB845	
Chip control ++ Surface finish+++ R_a 0,2 - 0,8 µm *(Surface finish+++ R_a 8 - 31 µin)*	
Lead geometry - EBS845	
Chip control ++ Surface finish+++ R_a 0,2 - 0,8 µm *(Surface finish+++ R_a 8 - 31 µin)*	





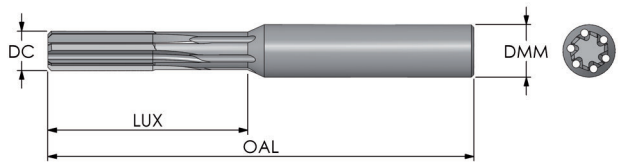
Note: for small diameter lead geometry length dimensions may be slightly smaller than above.

Geometry choice – Applications

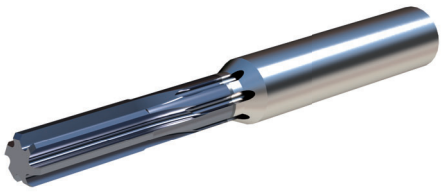
Lead geometry - EB25	
Feed performance +++ Surface finish ++ R_a 0,4 - 0,8 µm *(Surface Finish ++ R_a 16 - 31 µin)* Chip control +	
Lead geometry - EB30	
Feed performance +++ Surface Finish ++ R_a 0,4 - 0,8 µm *(Surface Finish ++ R_a 16 - 31 µin)* Chip control +	
Lead geometry - EBS30	
Feed performance +++ Surface finish ++ R_a 0,4 - 0,8 µm *(Surface Finish ++ R_a 16 - 31 µin)* Chip control + Short EB30	

Note: for small diameter lead geometry length dimensions may be slightly smaller than above.

Geometry choice – Applications



Lead geometry - EB60	
Feed performance + Surface Finish ++ R_a 0,8 - 1,2 µm *(Surface Finish ++ R_a 31 - 47 µin)* Chip control ++	
Lead geometry - EB75	
Feed performance + Surface Finish ++ R_a 0,8 - 1,2 µm *(Surface Finish ++ R_a 31-47 µin)* Chip control ++	



Note: for small diameter lead geometry length dimensions may be slightly smaller than above.

Grades		
	**RX2000**	**Coated** High performance coated grade suitable for all materials.
	**CP20**	**Coated** A versatile coated grade suitable for most materials, except aluminum. TiN
	**H15**	**Uncoated** A tough micrograin grade for all materials. Suitable for fine-reaming operations due to edge sharpness.
	**RN2010**	**Uncoated** A sub-micrograin uncoated grade with optimized geometries for N-materials (non ferrous).
	**RM2020**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for M materials.
	**RM2090**	**Coated** A wear resistant coated grade with specific geometries for M materials. Optimization in M materials.
	**RK2050**	**Coated** A tough coated grade suitable for fine reaming operation with optimized geometries for K materials.
	**RS2090**	**Coated** A wear resistant coated grade with specific geometries for S materials. Optimization in S materials.

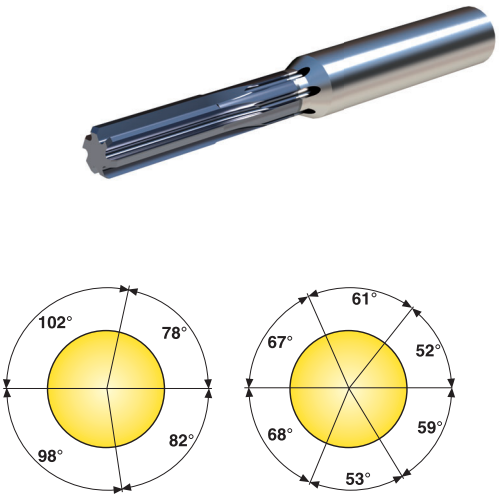
Regrinding instructions



Specifications

Diamond grinding wheel
Grain size:
D6 for 1st clearance angle (β1 - β3)
D64 for 2nd clearance angle (β2)

Important

Regrinding reduces reamer diameter.
Recoating may produce oversized diameter.
Max run-out on lead chamfers 10 µm *(394 µin)*.

Nanojet ∅ mm *(inch)*	β_1	β_2	β_3	T mm *(inch)*
1,461-2,460 *(0.0575-0.0968")*	8°	21°	8°	0,10 *(0.004")*
2,461-2,960 *(0.0969-0.1165")*	8°	18°	8°	0,10 *(0.004")*
2,961-9,960 *(0.1166-0.3921")*	8°	18°	8°	0,15 *(0.006")*

Bifix®

Bifix® indexable blade reamers bring high-precision performance to all workpiece material groups

- Enables tolerances held between 8 and 16µm and a surface finish of Ra 0.25 (RMS 12 micro/inch)
- Indexable blades feature two cutting edges per blade
- Three cermet guide pads and an accurate adjusting system

Range overview

	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
SR80 For through holes 	6,875-60,500 mm *(0.2707-2.3819")*	5-7 x D	IT 6	Yes, available through My Design	R_a 0,2-0,8 µm *(R_a 8-31 µin)*
SR81 For blind holes 	7,875-60,500 mm *(0.3100-2.3819")*	5-7 x D	IT 6-7	Yes, available through My Design	R_a 0,2-0,8 µm *(R_a 8-31 µin)*
SR82 For blind holes short version 	7,875-60,500 mm *(0.3100-2.3819")*	3-5 x D	IT 6-7	Yes, available through My Design	R_a 0,2-0,8 µm *(R_a 8-31 µin)*

Code keys

Reamers

Reamer type:
Type 80: Through hole
Type 81: Blind hole
Type 82: Blind hole, short version

Reamer type:
Type 80: Through hole
Type 81: Blind hole
Type 82: Blind hole, short version

Hole diameter and tolerance

Type of lead geometry
EN1, EN2, EN3

SR80 - **16.85 P6** - **EN1** - **R** - **9**

0.6624”-0.6628”

Shank type: (to be stated when requested style is not standard)
SR80 and SR81: R1 without flat is standard
SR82: R9 with flat is standard

Blades

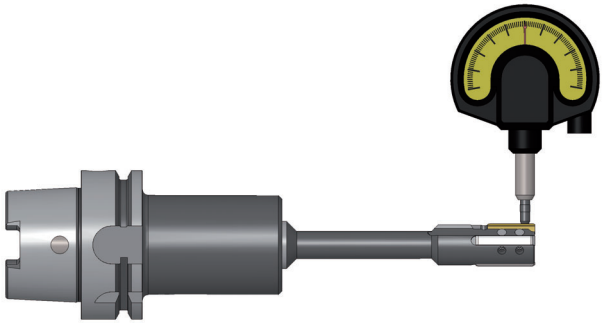
Important:
The reamer and the blade must have the same lead geometry.

Blade size:
P0, P1, P2, P4

Cutting rake angle:
0°, 6°, 12°

P2 - **EN1** - **06** - **CP20**

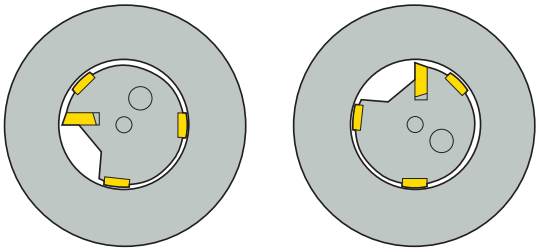
Type of lead geometry
EN1, EN2, EN3



Carbide grade:
CP20, H15

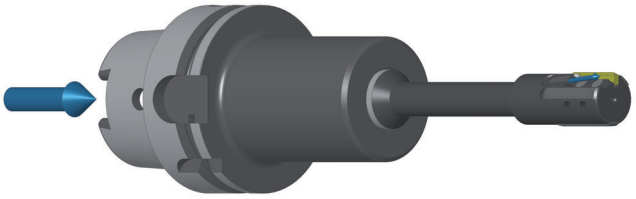
Set up and machining data

Rotating tool



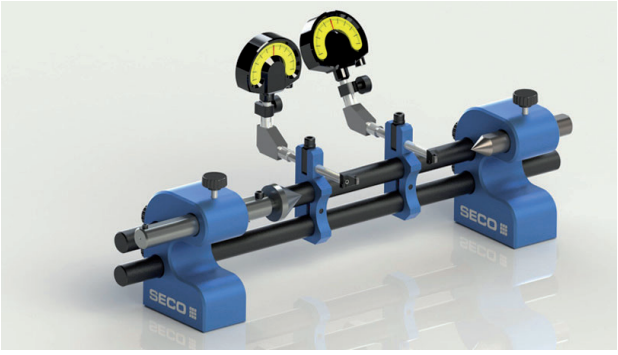
Max. run-out recommended: 0,02 mm *(0.0008")*.
Precision holder is recommended : Hydraulic chuck, D-type collet chuck, 5672 collet chuck or shrink-fit.

Stationary tool
Use a Seco floating holder, see page 505-509.



For optimal chip evacuation

Recommended blade orientation for static tools (see drawing, view from front of tools).



Coolant requirements

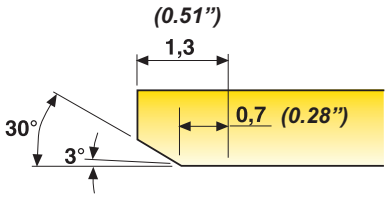
To reach maximum tool life and hole quality, the following coolant requirements should be observed.
Coolant through the tool is recommended. External coolant supply can be used if reaming depth < 2 x D.
Quality soluble oil with 40% minimum mineral oil. Neat oil recommended for stainless steel.
Filtration 30–50 µm *(1200-2000 µin)*.
Volume min 0,5 l/min/mm *(3.35 gal/min/inch)* in tool diameter.
Ex: Reamer ∅ 10, min volume is 5 l/min *(1.3 gal/min)*.

Setting fixture

SF-60200-C160C190: Part No. 02885396
- Horizontal stand
- First choice for Ø smaller than 60 mm *(2.362")*
- 2 clocks
- Maximum tool Ø: 60,5 mm *(2.382")*
- Maximum tool length: 200 mm *(7.784")*

Geometry choice – Blades

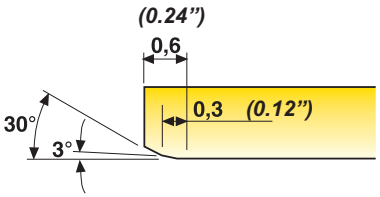
Note that reamer and blade must have the same lead geometry.



Grade and rake angle
Use the tables on page(s) 702-708 to classify the workpiece material into SMG.

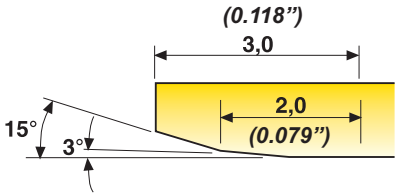
Use the cutting data recommendation table on page 438-446 to choose grade and rake angle.

The blade programme is on page(s) 436, 437.



EN1 – Application

Maximum machining allowance on ∅ 0,5 mm *(0.020")*
Surface Finish + R_a 0,3 - 0,8 µm
(Surface Finish + R_a 12 - 31 µin)



EN2 – Short lead

Maximum machining allowance on ∅ 0,3 mm *(0.012")*
Surface Finish + R_a 0,4 - 1,2 µm
(Surface Finish + R_a 16 - 47 µin)
Maximum feed rate 0,2 mm/rev *(0.008" in/rev)*.
Only to be used when a short lead is required
Designed with end cutting

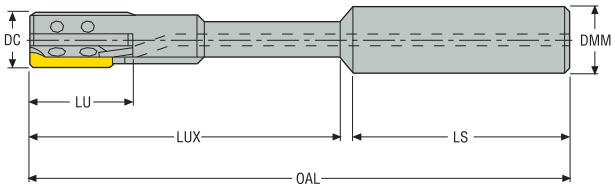
EN3 – Extreme surface finish

Maximum machining allowance on ∅ 0,5 mm *(0.020")*
Surface Finish + R_a 0,2 - 0,6 µm
(Surface Finish + R_a 8 - 24 µin)
Suitable for all materials except aluminium
To be used when R_a should be < 0,3–0,4 µm *(12-16 µin)*

Optimization / Grades

Use the blade selection table to choose alternative blades for higher productivity or better security

Blade selection



Blade size	Steel	Stainless steel	Cast iron	Non-ferrous	Aluminium	Wear resistance ⟷ Toughness			Designation	
						Productivity	Versatility	Security	Blade	Grade
P0, P1, P2, P4										
			•	•				X	Pxx-ENx-00	H15
	•		•		•			X	Pxx-ENx-06	H15
		•		•	•			X	Pxx-ENx-12	H15
	•					X			Pxx-ENx-00	CP20
	•		•				X		Pxx-ENx-06	CP20
	•	•					X		Pxx-ENx-12	CP20
	•		•			X			Pxx-ENx-00	CP15
	•		•			X			Pxx-ENx-06	CP15
	•	•		•	•	X			Pxx-ENx-12	CP15

Grades

	**CP15**	**Coated** A wear-resistant coated grade alternative to CP20. For optimization in cast iron and steels. Also suitable for non-ferrous. Ti(C, N)
	**CP20**	**Coated** A versatile coated grade suitable for most materials, except aluminum. TiN
	**H15**	**Uncoated** A tough micrograin grade for all materials. Suitable for fine-reaming operations due to edge sharpness.

For through holes ∅ 7H6-26H6

Shank type R1, cylindrical without flat, SR80

SMG = Seco material group
a_p = *inch*
f = in/rev
v_c= sf/min
All cutting data are start values

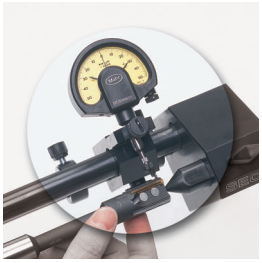
Adjustment instructions

1.		Loosen the two adjustment screws (7) by a 1/4 turn.
2.		Loosen the two clamping screws (5).
3.		Clean the blade seat thoroughly then, index the used blade (2) edge or replace it.
4.		Firmly push the blade against the axial end stop and the adjustment balls (6).
5.		Tighten the clamping screws carefully. (Hold the key at its shortest end for correct torque).
6.		Set the µm clock to zero using the cylindrical rear end of guiding pads (3).

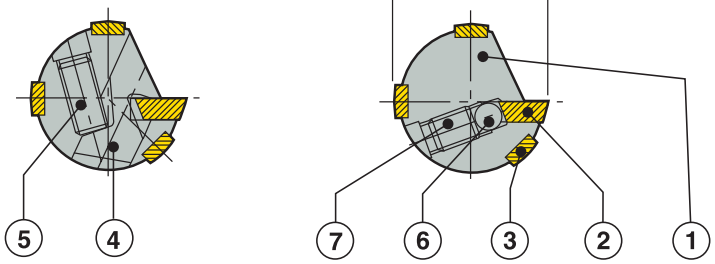


Adjustment instructions

7.

Set the rear end of the blade to a diameter so that a back taper of 0,01 mm/10 mm *(0.0004" per every 0.394")* blade length is achieved (see figure 2).

8.



Set the µm clock to zero using the cylindrical front end of guiding pads (3).

9.

Set the front end of the blade to 0,02 mm or 0,015 mm *(0.0008" or 0.0006")* above the guide pads (3) clock A, see figure 1.
Check again back taper value (steps 6 and 7) clock B.

10.

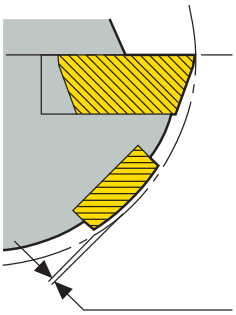


figure 1

0,015 mm (∅ ≤ 10 mm)
0,020 mm (∅ >10 mm)
Clock A value for ∅ setting

0,0006" (∅ ≤ 0.394")
0,0008" (∅ > 0.394")
Clock A value for ∅ setting

Note: If the required diameter is exceeded during adjustment, start again from the beginning to eliminate backlash on adjustment screws.

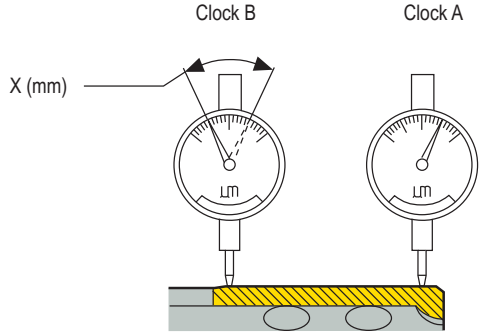

figure 2

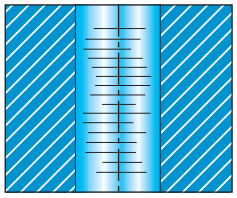
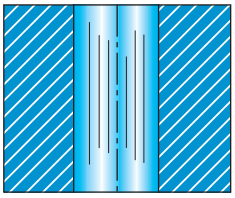
- Clock unit = 1 µm *(39 µin)*
- Front and rear clock values valid when set zero on adjacent pad
- Rear clock values calculated on back taper of 1 µm/mm *(0.00004")* of blade



Setting chart

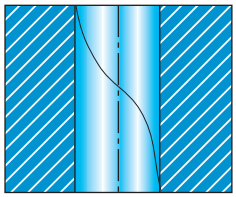
Diameter range mm *(inch)*	Blade size	Front Clock A	Rear Clock B
6,875-8,749 *(0.271-0.344")*	P0	+15	-5
8,750-10,000 *(0.344-0.394")*	P1	+15	-5
10,001-12,749 *(0.394-0.502")*	P1	+20	0
12,750-19,499 *(0.502-0.768")*	P2	+20	0
19,500-60,500 *(0.768-2.382")*	P4	+20	0

Troubleshooting



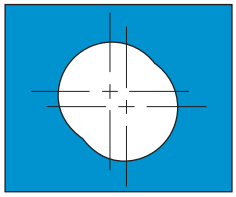
Poor surface finish

- Check material allowances
- Improve coolant conditions (outlet type, pressure, quality)
- Reduce feed rate
- Change blade (wrong lead geometry or wrong rake angle)
- Check axial position of blade



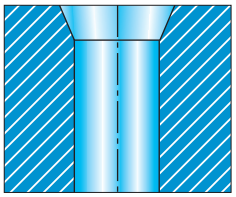
Facets

- Improve centering (part/tool)
- Increase back taper



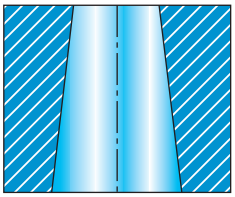
Retraction marks

- Improve coolant conditions (outlet type, pressure, quality)
- Improve centering (part/tool)
- Increase back taper



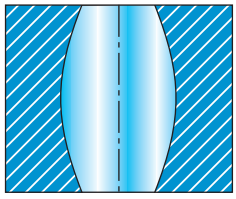
Off center/Ovality

- Improve clamping (workpiece deformation)
- Check material allowance
- Improve centering (part/tool)
- Check axial position of blade



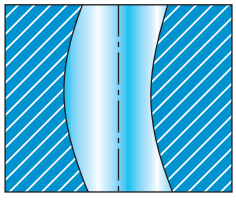
Tapered entry

- Reduce feed rate
- Improve centering (part/tool)
- Check back taper
- Reduce radial run-out



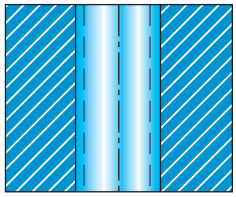
Tapered hole

- Improve centering (part/tool)
- Check back taper



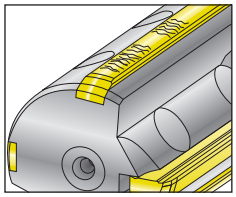
Deformed hole

- Improve clamping (workpiece deformation)



Curved hole

- Change blade (wrong lead geometry)
- Check axial position of blade



Too large diameter

- Improve centering (part/tool)
- Adjust diameter (too large)

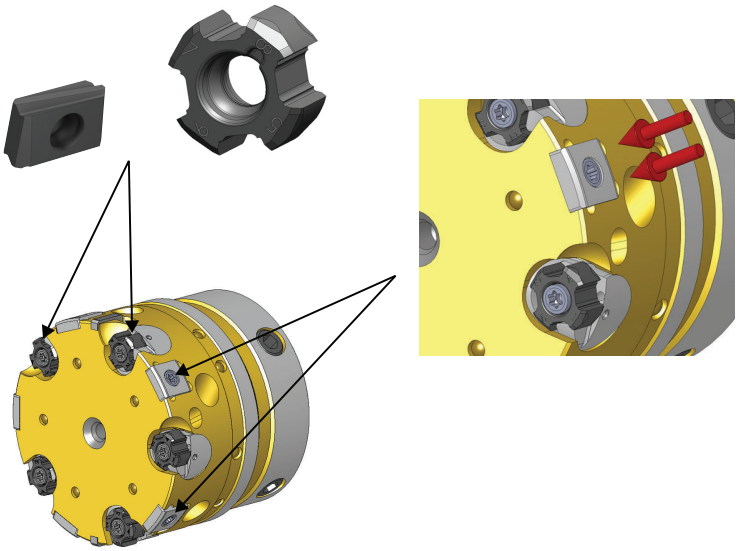
Adhesion to pads

- Improve coolant conditions (outlet type, pressure, quality)
- Adjust diameter (too small)

Xfix™

Xfix™ large-diameter, multi-tooth reamers are all about bringing the highest possible performance and precision to hole production.

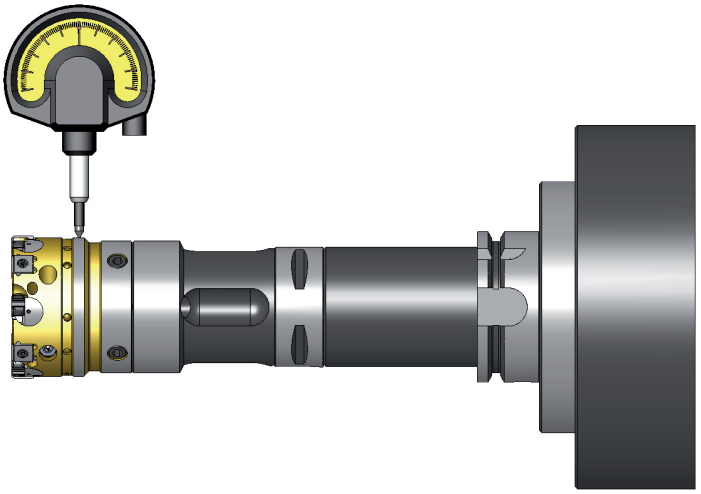
- Hole depths up to 6,5xD within a diameter of 9.5 – 154.5 mm (2.03”- 6.083”)
- Quick and easy to adjust, only one screw per tooth is required to set diameter
- Accurate adjusting system to achieve tight tolerances between 16 to 25 μm (.0006”-.0010”)
- Inserts that have either four or eight numbered edges



Range overview

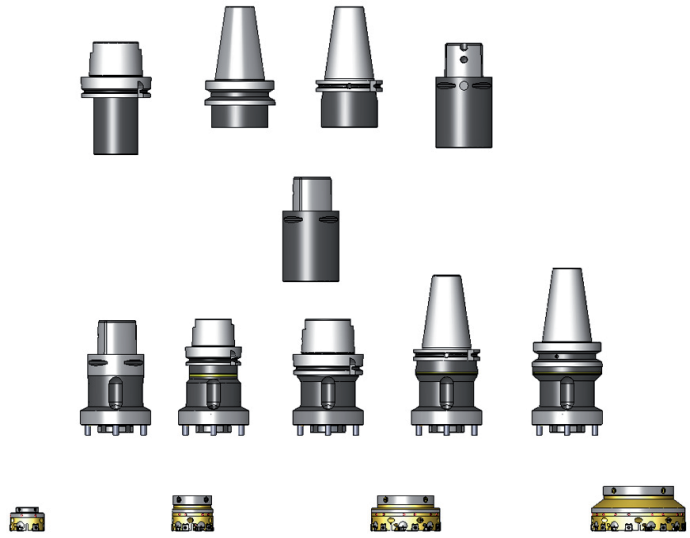
	∅ Range	Reaming depth	Hole ∅ tolerance	Intermediate diameter	Surface finish
Xfix™ 	39,500-154,500 mm *(1.5551-6.0827")*	2,5-6,5 x D	IT 6	Yes, available through My Design	R_a 0,8-1,2 µm *(R_a 31-47 µin)*

Xfix™ is a specially developed Seco Reaming programme, dedicated for large ∅ 39,5 – 154,5 mm *(1.555" – 6.083")*.
Design includes adjustable and indexable inserts to achieve IT 6 accurate tolerance, as well as a built in adjustable run-out adapter to guarantee component quality.
Multi-teeth construction and patented pre-loaded guiding pads offering maximum stability and productivity for large ∅ reaming operations.



Feature details

- 4 or 8 cutting edges for optimisation in all materials
- Stable clamping system
- Easy adjustment with 1 adjusting screw for easy setting
- Grade and geometry choice for different applications



- Patented pre-loaded guiding pads system for application stability
- Pads lubrication for performance and safety

- Integrated adjustable adapter for perfect run-out control

- Shanks and extension program from Seco Tooling Systems catalog offer maximum modularity

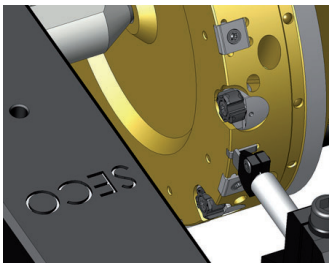
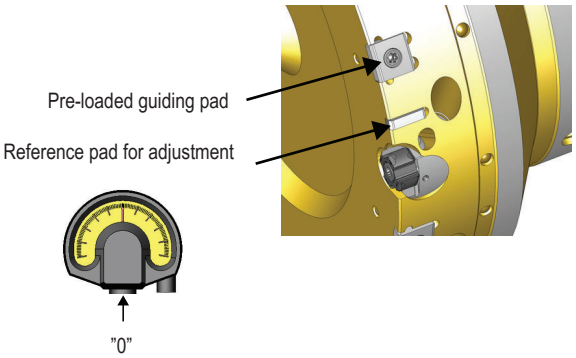
Adjusting instructions

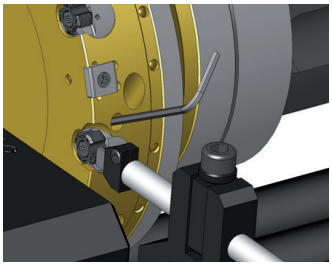
1.



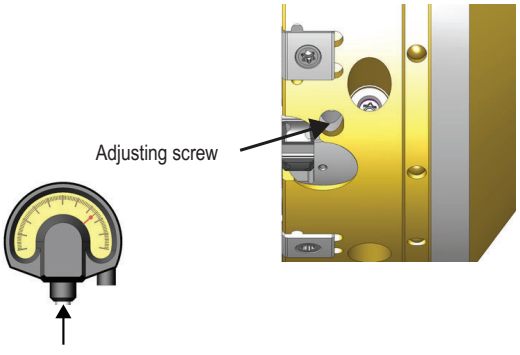
- Loosen cartridge clamping screw.
- Index or replace insert.
- Unclamp adjusting screw by 1/4 of a turn and push cartridge back.
- Gently re-clamp cartridge clamping screw 0,5 Nm approx *(4.4 in/lbs)*.



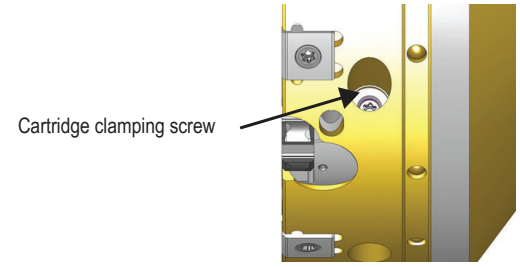
2.



- Set clock to “zero” on reference pad.
- Make sure measuring point is positioned after the lead angle.



3.

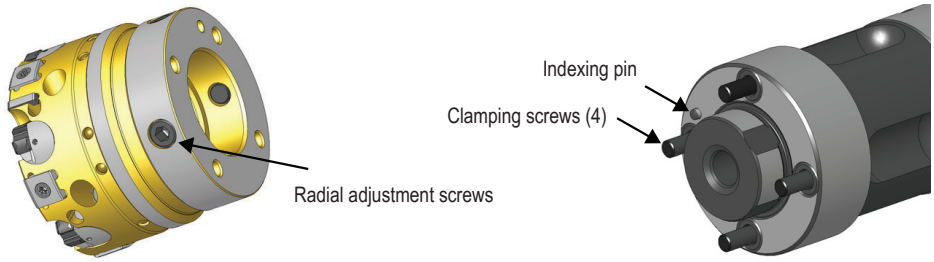


- Set insert 0,025 mm *(0.001“)* above reference pad using adjusting screw.
- Repeat adjusting process for all inserts.

4.

- Final clamp cartridge clamping screw 2 Nm *(17.7 in/lbs)*.

Note: If the required diameter is exceeded during adjustment, start again from the beginning to eliminate backlash on adjustment screws.



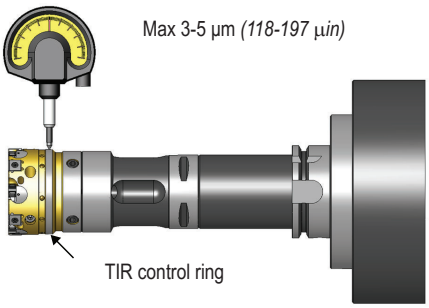
Adjusting instructions, adapter

1.

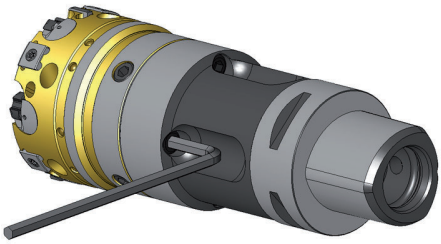
Assembly

- Thoroughly clean flange contact surface.
- Loosen 4 radial adjusting screws so they do not interfere for assembly.
- Put reaming head onto adapter (indexing pin) and tighten the 4 clamping screws.

Assembly (drawing 1)



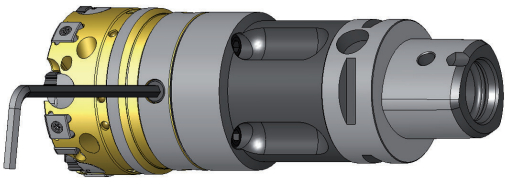
2.



Setting

- Mount tool in the machine spindle.
- Place µm clock as shown in (drawing 2).
- Unlock spindle so it can rotate freely by hand.
- Start run-out correction using 4 adjusting screws (drawing 3).
- Max run-out 5 µm *(197 µin)*.
- When run-out values get lower than 10 µm *(394 µin)*, proceed to final clamping (drawing 1) see clamping torque table for torque recommended values.

Setting operation in the machine spindle (drawing 2)

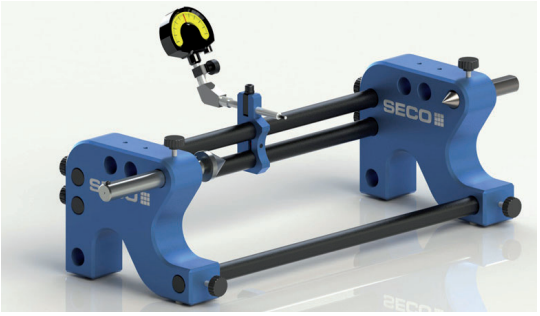


Clamping screws (drawing 3)

3.

- Finalize run-out adjustment, max 5 µm *(max 197 µin)*.

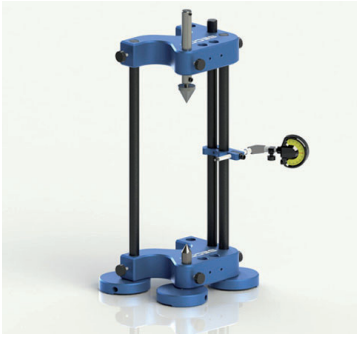
Radial adjusting screws (drawing 4)



Clamping torque table

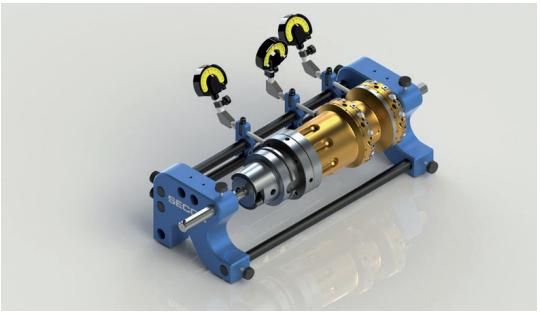
Diameter mm	*Diameter inch*	Adapter size	Clamping screw	Clamping torque Nm	*Clamping torque in/lbs*
39,5-59,499	*1.555-2.342*	HF32	CHC M3 x 16	2,7	*24*
59,5-84,499	*2.342-3.372*	HF55	CHC M5 x 25	5,7	*50*
84,5-119,499	*3.372-4.705*	HF80	CHC M6 x 25	9,8	*87*
119,5-154,499	*4.705-6.083*	HF100	CHC M8 x 30	24	*212*

Setting fixture – Single clock



SF-210340-C160: Ordering and Part No. 02885391

- Horizontal stand
- First choice for Xfix reamers
- 1 clock
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 340 mm *(13.386")*
- Included in delivery: additional Ø 57 mm *(2.244")* spring center for HSK 63/80/100 and Capto C8 SSC5700 Part No. 02208620

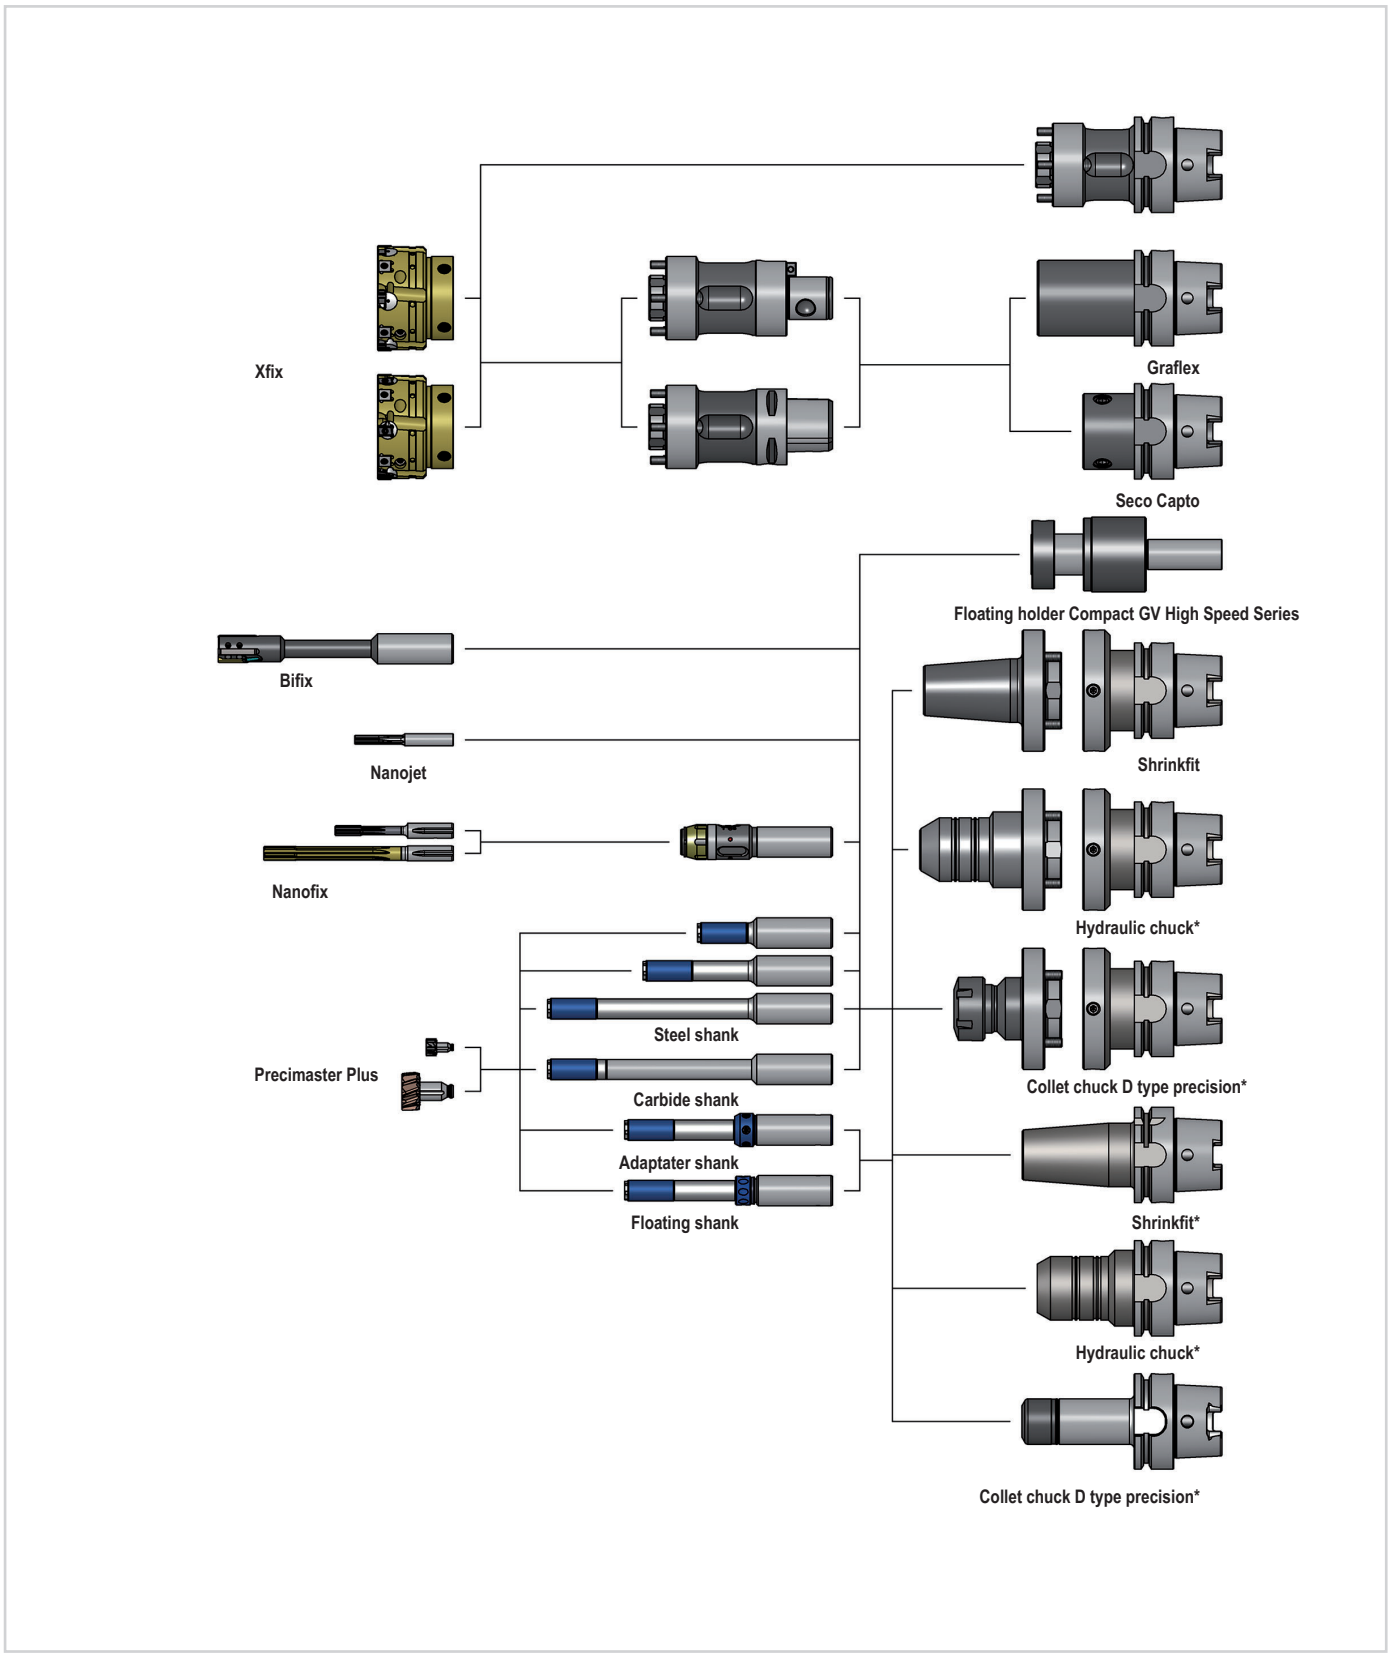


SF-210290V-C160: Ordering and Part No. 02885392

- Vertical stand
- First choice for Xfix reamers
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 290 mm *(11.417")*
- Included in delivery: additional Ø 57 mm *(2.244")* spring center for HSK 63/80/100 and Capto C8 SSC5700 Part No. 02208620

Setting fixture – Multiple clocks

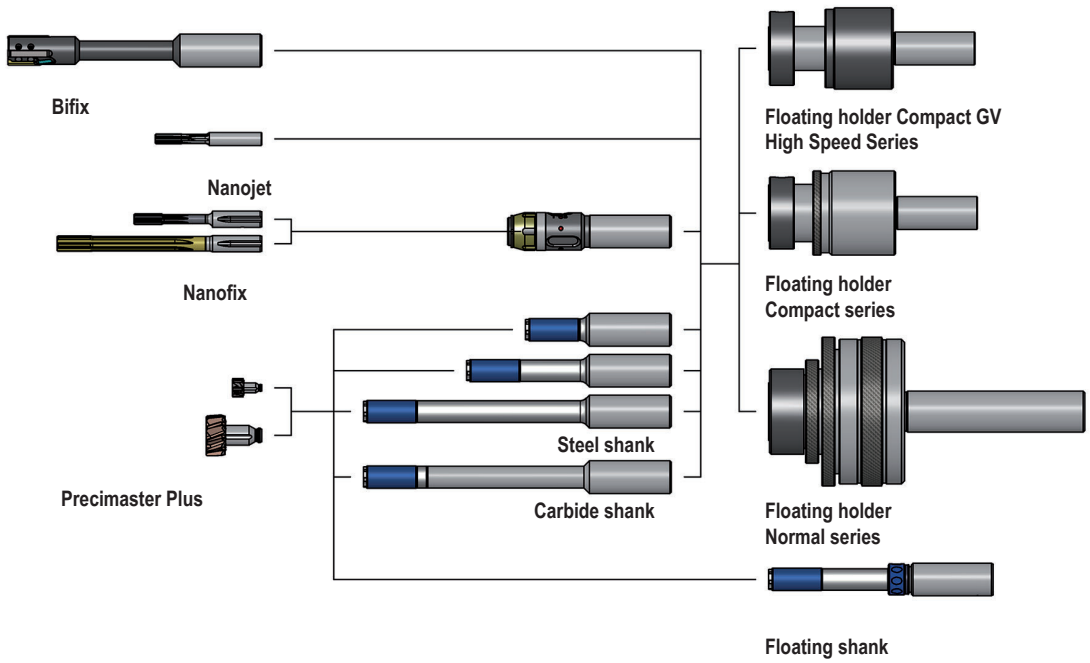
Possibilities for multi-clock set up, refer to setting fixture chapter page 510-515 for more details



Tooling overview

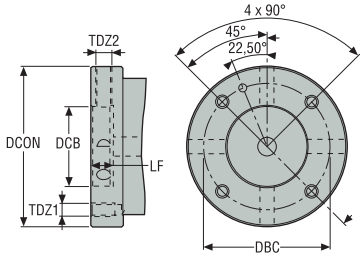
Diameter mm	*Diameter inch*	Max dia/ length ratio
39,5-59,499	*1.555-2.342*	6,5 x D
59,5-84,499	*2.342-3.372*	4,5 x D
84,5-119,499	*3.372-4.705*	3,3 x D
119,5-154,499	*4.705-6.083*	2,5 x D

Note: For diameters > 100 mm *(3.937")* or L > 3 x D check max tool weight acceptable in the machine.



Rotating applications

*See catalog TOOLING SYSTEMS



Best performance achieved with rigid mounting (Hydraulic chuck, D type or Shrinkfit)

Static applications

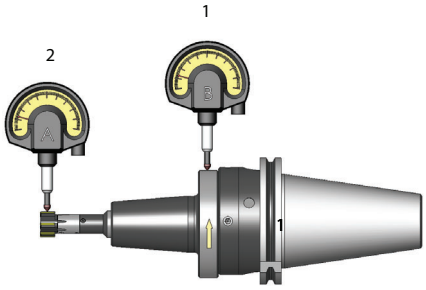
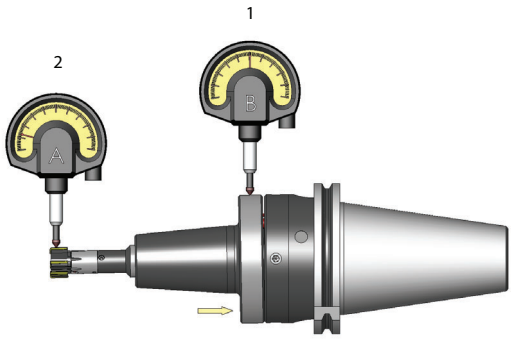
Assembly instructions

- Clean contact surface
- Make sure radial adjusting screws are not interfering with the assembly

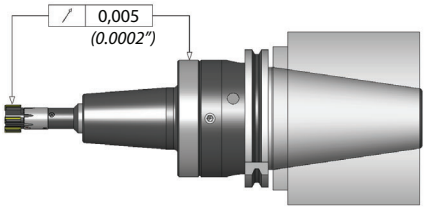


- Make sure angular adjusting screws are not interfering with the assembly



- Proceed to assembly and gently pre-clamp clamping screws (x4)

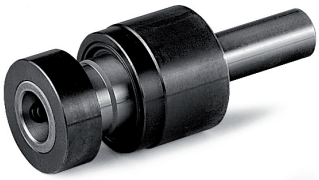
Adjusting instructions



- Mount tool in the machine spindle
- Set up clock 1 as shown (clock 2 not needed at this stage)
- Rotate tool manually until lowest point is reached
- Proceed to radial run-out compensation as shown with arrow
- Check and repeat compensation if necessary

- Set up clock 2 as shown
- Rotate tool manually until lowest point is reached
- Proceed to radial run-out compensation as shown with arrow
- Check and repeat compensation if necessary

- When finished with adjustment, run-out <5 µm *(197 µin)*, finalize clamping to secure assembly
- Adjustable adapter can be pre-set away from the machine using any tool pre-setting device available in the workshop
- Final adjusting must always be made in the machine spindle
- Micron clock must be used. It is acceptable to use one clock for both operations



Range overview

The use of a Seco floating holder is recommended

- When run-out exceeds 0.02 mm *(0.0008")*
- For stationary tools

Compact GV high speed series

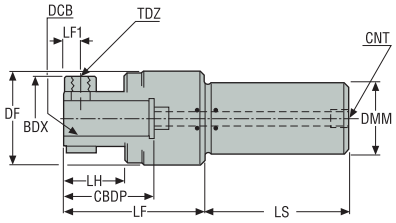
- First choice for rotating tools
- No adjustment required (factory preset)
- Rotation up to 3000 RPM depending on application
- Suitable for static applications

Compact series

- First choice for stationary tools
- Radial adjustment only
- Suitable for rotating applications – 800 RPM max

Normal series

- When both angular and radial correction is required
- Suitable for rotating applications – 800 RPM max



All floating holders for through coolant.
2 types of coolant induction available.

JJL: side inlet
JJ: through shank

Users manual included in delivery.

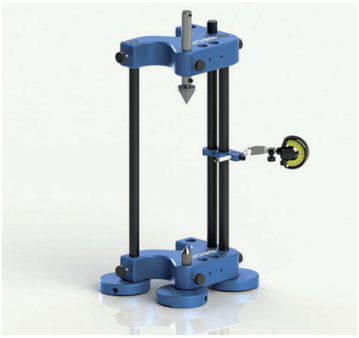
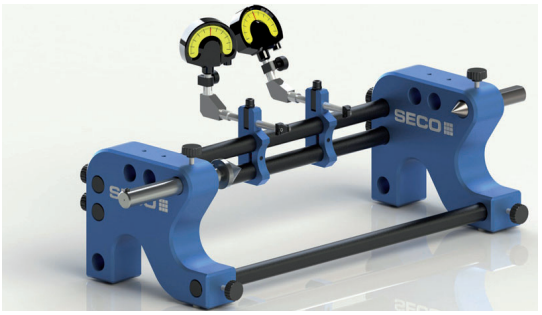
Setting fixture – Single clock



SF-210340-C160: Ordering and Part No. 02885391

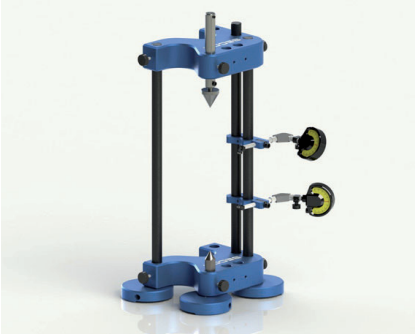
- Horizontal stand
- First choice for Xfix reamers
- 1 clock
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 340 mm *(13.386")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620

SF-210290V-C160: Ordering and Part No. 02885392



- Vertical stand
- First choice for Xfix reamers
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 290 mm *(11.417")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620

Setting fixture – Dual clock

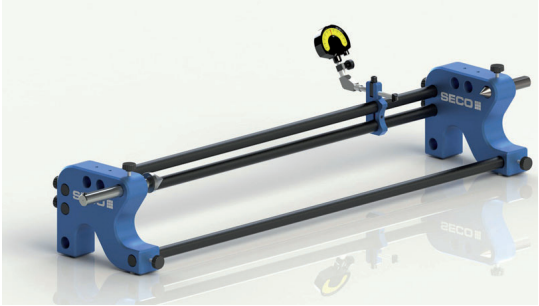


SF-210340-C160C190: Ordering and Part No. 02885393

- Horizontal stand
- First choice for Bifix reamers
- 2 clocks
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 340 mm *(13.386")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620 delivery

SF-210290V-C160C190: Ordering and Part No. 02885394

- Vertical stand
- First choice for Bifix reamers
- 2 clocks
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 290 mm *(11.417")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620



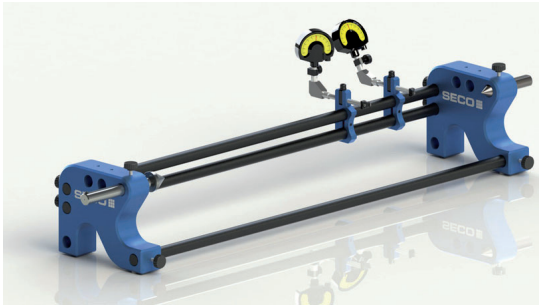
For ordering information, contact your local Seco Tools representative.

Setting fixture – Single clock large capacity

SF-210740-C160: Ordering and Part No. 02885385

- Horizontal stand
- First choice for Xfix reamers
- 1 clock
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 740 mm *(29.134")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620

SF-210690V-C160: Ordering and Part No. 02885387



- Vertical stand
- First choice for Xfix reamers
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 690 mm *(27.165")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620

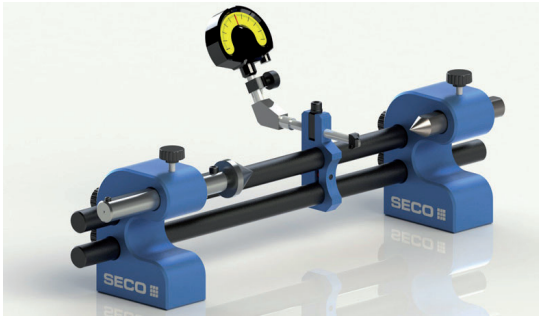
Setting fixture – Dual clock large capacity

SF-210740-C160C190: Ordering and Part No. 02885388

- Horizontal stand
- First choice for Bifix reamers
- 2 clocks
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 740 mm *(29.134")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620delivery

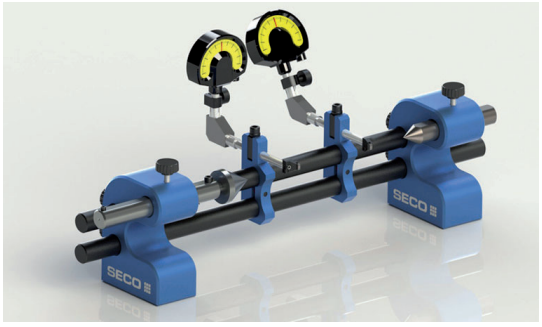
SF-210690V-C160C190: Ordering and Part No. 02885390

- Vertical stand
- First choice for Bifix reamers
- 2 clocks
- Maximum tool Ø: 210 mm *(8.268")*
- Maximum tool length: 690 mm *(27.165")*
- Included in delivery: additional Ø 57 mm *(2.224")* spring center for HSK 63/80/100 & Capto C8 SSC5700 Part No. 02208620



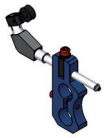
For ordering information, contact your local Seco Tools representative.

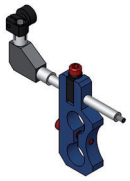
Setting fixture – Compact



SF-60200-C160: Ordering and Part No. 02885395

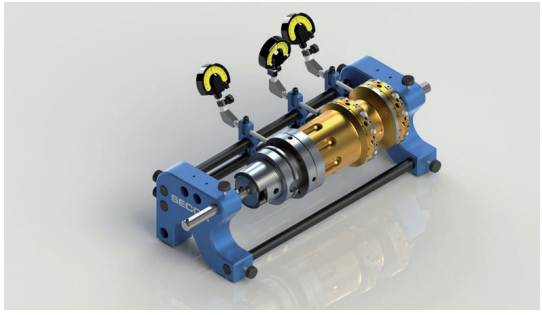
- Horizontal stand
- First choice for Ø smaller than 60 mm *(2.362")*
- 1 clock
- Maximum tool Ø: 60,5 mm *(82.382")*
- Maximum tool length: 200 mm *(7.874")*

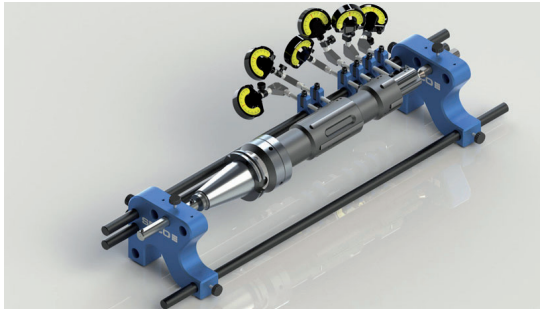




SF-60200-C160C190: Ordering and Part No. 02885396

- Horizontal stand
- First choice for Ø smaller than 60 mm *(2.362")*
- 2 clocks
- Maximum tool Ø: 60,5 mm *(82.382")*
- Maximum tool length: 200 mm *(7.874")*

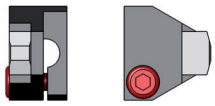




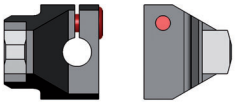
For ordering information, contact your local Seco Tools representative.

Additional measuring arms

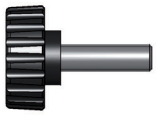
	**SFB-60: Ordering and Part No. 02208619** • Measuring arm 60° • Dial gauge included in delivery • Measuring point not included, see page 514
	**SFB-60 WC: Ordering and Part No. 02885754** • Measuring arm 60° • Dial gauge not included in delivery • Measuring point not included, see page 514
	**SFB-90: Ordering and Part No. 02208622** • Measuring arm 90° • Dial gauge included in delivery • Measuring point not included, see page 514
	**SFB-90 WC: Ordering and Part No. 02885755** • Measuring arm 90° • Dial gauge not included in delivery • Measuring point not included, see page 514
	**DG-1: Ordering and Part No. 75079579** • Dial gauge, 1 µm *(39 µin)*



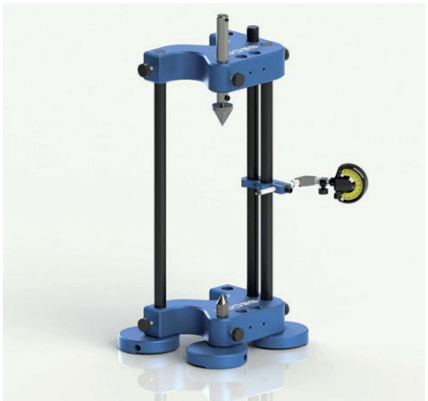
Examples of multi clocks setting fixture assembly



Accessories



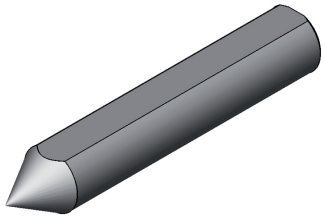
SMES-406: Ordering and Part No. 02819156
- Measuring point for Xfix reamers
- Ø 4mm *(0.157")*
- Carbide tipped



SMES-900: Ordering and Part No. 02208610
- Measuring point for Bifix reamers
- Carbide tipped

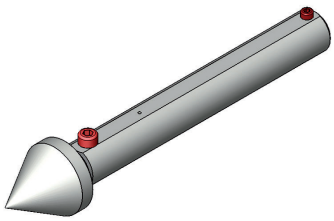
SMES-909:Ordering and Part No. 02980090
- Measuring point for Bifix reamers
- Carbide tipped
- 9 mm *(0.354")* offset

SFHS-20: Ordering and Part No. 02884025
- Hand-screw
- Suitable for the entire setting fixture range



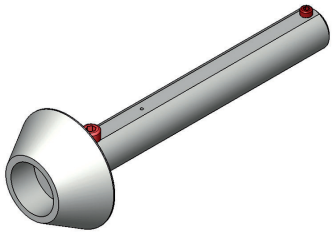
SFVST- 100: Ordering and Part No. 02884026
- Steel stand (set of 3)
- Ø 100 mm *(3.937")*
- Suitable to convert horizontal setting fixture to vertical position

Centre points



SFC-2000HM: Ordering and Part No. 02884023

- Solid carbide fixed center point
- Ø 20 mm *(0.787")*
- Suitable for Xfix and Bifix range standard and special
- To be used at front end of the tool



SSC-3400: Ordering and Part No. 02208617

- Spring center point
- Ø 34 mm *(1.339")*
- Suitable for Xfix and Bifix range standard and special
- To be used at back end of the tool
- Not suitable for HSK63/80/100 and capto C8

SSC5700: Ordering and Part No. 02208620

- Spring center point
- Truncated Ø 57 mm *(2.244")*
- Suitable for Xfix and Bifix range standard and special
- To be used at back end of the tool
- Suitable for HSK63/80/100 and capto C8

Overview

Graflex® and Seco-Capto™

Graflex® and Seco-Capto™ arbors, extensions and reducers to build boring bars

- Boring bars assemblies can be rapidly built together to the closest required needs, either by using the Graflex or the Seco-Capto modular systems including a wide range of arbors and intermediaries.
- Both systems offer a rigid and precise connection to be used for roughing applications or finishing holes.
- The modules can also receive a large number of tool holders like collet chucks, hydro chucks etc. (see Tooling systems catalog).

Page(s) 518-577, 578

RB750 boring heads, rough boring

Twin cutting heads, with insert holders coupling mechanism

- High metal removal, precise hole geometry and hole position
- Both symmetrical and staggered settings
- Simultaneous adjustment by an insert holders coupling mechanism
- With Graflex® or Seco-Capto™ connections

Ø range 18 to 205 mm
(0.709 to 8.071")

IT 9/10

Page(s) 589, 590-596

RB 610 boring heads, rough boring

Twin cutting heads

- High metal removal, precise hole geometry and hole position
- Both symmetrical and staggered settings
- With Graflex® connection for Graflex® modular system
- With GL or BA connection for Steadyline® vibration damping bars

Ø range 28 mm to 116 mm
(1.102 to 4.567")

IT 9/10

Page(s) 602-605

FB 760 boring heads, Axiabore™ type, fine boring

Fine boring heads, with axial tools

- Micrometer adjustment for hole precision up to IT5
- High tool rigidity for precise hole geometry and position
- Nanobore™ head for smaller diameters
- Axialibrabore™ and - Axialibrabore™ Plus - are fine balanceable, HSM suitable
- Multi-purpose adapter (MPA) for larger boring diameters, OD-overturning and grooving
- With Graflex® or Seco-Capto™ connections

Ø range 0,3 to 108 mm
(0.012 to 4.252")

+ OD-overturning and face grooving

IT 5/6

Page(s) 614-629

Overview

FB 620, FB 780 and FB 790 boring heads, radial type

Fine boring heads, with radial insert holder

- Micrometer adjustment for hole precision up to IT5
- Precise hole geometry and position
- A790 Libraflex® heads are fine balanceable, HSM suitable insert holder clamping for highest reliability
- Long bores achievable, using carbide extensions (up to 7xD) or Steadyline® bars (up to 10xD)
- Also for chamfering and back-boring
- With Graflex® or Seco-Capto™ connections for modular systems
- With GL or BA connection for Steadyline® vibration damping bars

Ø range 15 to 205 mm
(0.591 to 8.071")

IT 5/6

Page(s) 648, 649-657

Bridge bars and Jumbo boring heads

For rough and fine boring large diameters

- Boring blocks available for rough and fine boring, OD-overturning and back-boring
- Strong design for high metal removal in rough boring
- Micrometric adjustment for fine boring
- Optimized boring block design and Jumbo Bridge bars made from high tensile aluminum for high speeds
- To be fitted onto milling cutter holders, flange mounting type

Ø range 204 to 3205 mm
(8.031-126.181")

IT 5/6 (fine boring) or 9/10 (rough boring)
+ OD-overturning

IT6

Page(s) 659-676

Inserts for boring

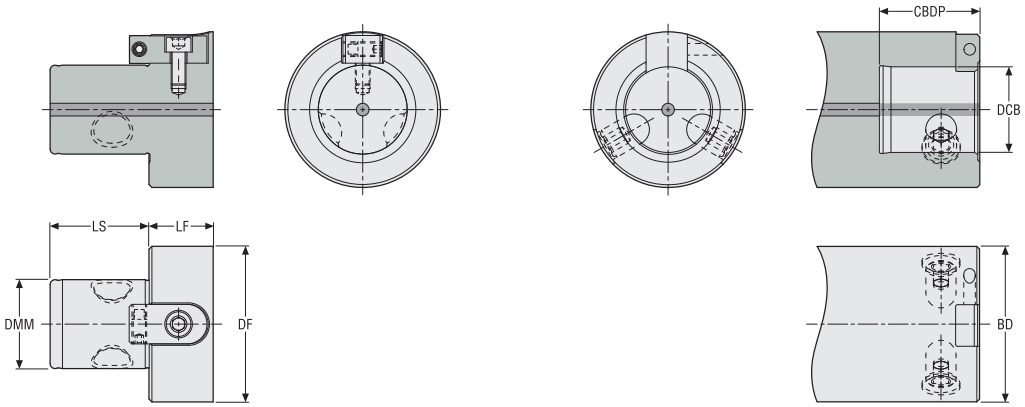
- For boring applications in all materials
- High toughness for rough boring
- Positive geometries for fine boring
- Grades selected for long life

Page(s) 678-690

Graflex® or Seco-Capto™ modular holding system

- The boring heads have a Graflex® or a Seco-Capto™ machine side connection shank enabling a full range of boring depths and diameters
- Select the required Graflex® or Seco-Capto™ arbors and intermediates from the TOOLING SYSTEMS catalog (HSK, DIN, BT, ANSI-CAT, Seco-Capto™)
- Graflex® connections spare parts for boring heads are shown in that chapter

Page(s) 691-693



Graflex®

Graflex® assemblies include arbors, intermediates, tool holders and boring heads that can be rapidly built together when they are needed. Suitable for milling, drilling, tapping, reaming and boring, Graflex® modules offer tooling of variable lengths and diameters and can be fitted on all types of machines simply by substituting the Graflex® basic arbor.

- Excellent connection rigidity
- Wide range of modules offer high flexibility
- Through coolant possibilities

Seco-Capto™

Seco-Capto™ is a leading quick-change modular tooling system for quick setup and replacement of cutting edge holders. The Seco-Capto™ modular tooling range uses Polygonal Shank Coupling (PSC) in accordance with ISO 26623 and features a self-locking taper joint.

- Tool holders range, such as Shrinkfit, collet chuck and shell mill
- Seco-Capto™ basic arbors with HSK, DIN, BT connections
- Seco-Capto™ cassette for greater reliability and insert clamping

Seco-Capto™, norm dimensions

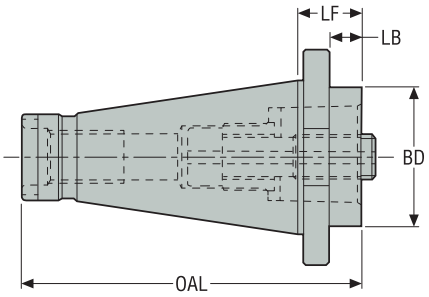
Note: These machine side and workpiece side dimensions are applied to all the holders shown in the product pages.

* The Seco-Capto™ machine side of short extensions can only be hold by spindles with segment clamping (not with center bolt clamping). The Seco-Capto™ machine side of short reducers can only be hold by spindles with segment clamping (not with center bolt clamping).



** In order to know if a hole for RFID carrier exists, see 'RFID hole' column in Product pages: 1= hole for RFID carrier available, if required a carrier can be fitted on request, please enquire.

0= hole for RFID carrier not available, if required hole can be machined and a carrier can be fitted on request, please enquire.

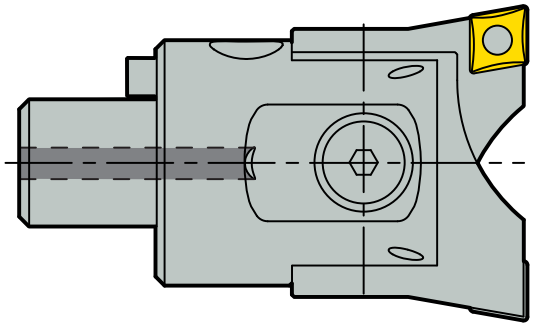
Rough boring

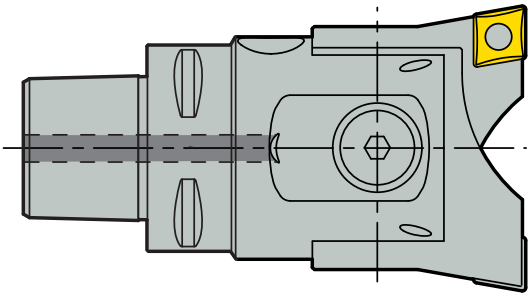
Seco's range of rough boring products maximize material removal rates and accuracy through strong, highly rigid performance. Designed for symmetrical and staggered designs. Steadyline™ vibration damping solutions complete the range to deliver even greater levels of stability for the machining of deep cavities, where long tool overhangs are needed.

- RB 750 rough boring heads offer the highest possible rough boring performance
- RB 610 rough boring heads are short, simple, robust boring heads for roughing operations



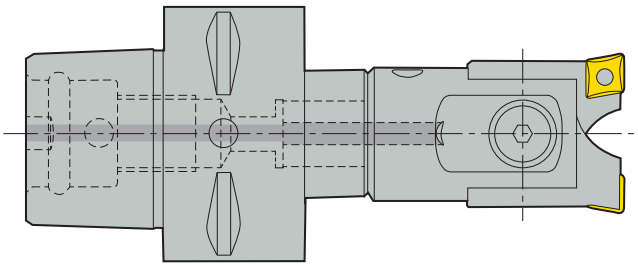
Overview Rough boring heads

Features



Graflex® rough boring heads

- Ø 18 to 205 mm *(0.709-8.071")*
- 8 rough boring heads RB 750 with Graflex® connection for bores Ø 18 to 205 mm *(0.709-8.071")*

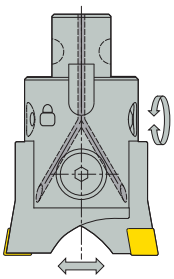


Seco-Capto™ rough boring heads

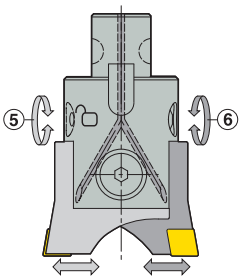
- **Note:** The minimum bore size of the smallest Capto™ rough boring head is Ø 39 mm *(1.535")* with the smallest available Capto™ C3 connection.
- For Ø 18 to 40 mm *(0.709-1.575")* use Graflex® boring heads with connection sizes G0 to G2 in conjunction with the appropriate Capto™/Graflex® adaptor.

Seco-Capto™ rough boring heads

- **Note:** Features, Instructions (insert holder fitting, diameter setting, back boring instructions, troubleshooting, recommended machining conditions, maximum speeds), suitable insert holders and suitable inserts are similar for both types of RB 750 rough boring heads of similar boring capacity size, regardless of connection type.
- Modular assemblies and cutting conditions Seco-Capto™ and Graflex® adapters and modular extensions: please see the Tooling Systems catalog.



Features



A rough boring head assembly is a combination of 1 body (head) and 2 insert holders.

Simultaneous or independent adjustments of the insert holders are possible:

Simultaneous adjustment by the insert holders coupling mechanism (no coupling mechanism in the smallest head Ø 18 to 24 mm *(0.709-0.9445")*. Each adjusting screw moves both insert holders simultaneously (they are gear coupled). Diameter adjustment is possible without a presetter (1 increment = 0,1 mm *(0.004")* on the diameter). Independent adjustment is also possible: disengage the coupling mechanism so that each adjusting screw acts only on its insert holder.

Simultaneous adjustment

Independant adjustment

Symmetrical boring:

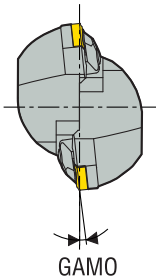
Symmetrical boring means both cutting edges are set on the same diameter: It requires two identical type A standard insert holders (with identical lead angle).

Staggered boring:

Staggered boring means one cutting edge is offset as a leading cutting edge operating on a smaller diameter than the second edge set on the diameter to be realised: It requires one type A standard insert holder and one type B extended insert holder, achieving the required (+) axial offset.

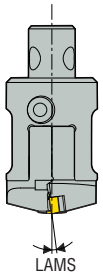
90° or 80° lead angle insert holders

A75…CC… and A75…CP… insert holders have a 90° lead angle for rhombic inserts: mostly suitable for blind holes and requiring less spindle torque.
A75…SC… insert holders have an 80° lead angle for square inserts: mostly suitable for through holes and heavy duty. Angular orientation of the cutting edges according to ISO.



CC, CP, SC or CN type insert holders

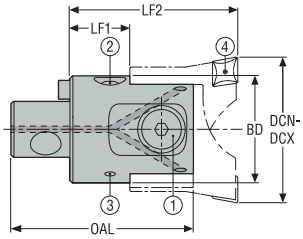
A750...CC..., A750...CP... and A750...SC... insert holders are with 0° rake angle (GAMO) and 0° inclination angle (LAMS).



A750...CN... insert holders are with -6° rake angle (GAMO) and -6° inclination angle (LAMS), allowing use of 'negative' CNMM inserts and particularly multi-edges CNMG inserts with 4 cutting edges.

In this case, it is particularly important to select the recommended CN inserts and to respect the recommended cutting data (see page 682).

Using other inserts, e.g. with smaller effective cutting angle, and/or incorrect cutting data, could result in high cutting stresses and machine / workpiece damage.

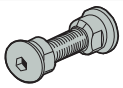


GAMO

LAMS

RB750

Graflex®



1. Assembly screw
2. Adjusting screw
3. Locking screw of coupling mechanism
4. Insert screw

- Symmetrical and staggered boring is possible
- Simultaneous adjustment by insert holders coupling mechanism

For rough boring recommended inserts, see page(s) 682

Instructions
Recommended machining conditions

Spindle power:

As rough boring requires high machine power, we recommend to check that the machine is suitable. Staggered boring is a solution to reduce the power needs, as the feed is divided by two for the same total depth of cut, compared to symmetrical setting.
Optimum performance is obtained with through coolant (higher machining data, better surface finish, better chip evacuation, longer insert life).

For detailed user instructions, please refer to the operating instructions supplied as part of the delivery content of the boring heads and with the Steadyline® bars.
These operating instructions can also be downloaded from www.secotools.com.

Maximum speeds for rough boring heads

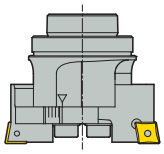
C8-391.0750-70	114-160	*4.488-6.299*	2500	895 *(2936)*	1257 *(4124)*
C8-391.0750-70	159-205	*6.260-8.071*	2000	999 *(3278)*	1288 *(4226)*

Note: The maximum speeds are related to the boring head's mechanical design and balancing quality. Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. work-piece material, cutting edge (insert), tooling length, machine spindle. At speeds from approx. 8000 RPM and above, the basic holders and the extensions/reducers should be fine balanced.

Troubleshooting instructions



Problem	Possible cause	Solution
Poor chip control	Feed rate too low	Increase feed rate
	Excessive DOC	Use staggered method
Chatter & Vibrations	Excessive speed	Reduce cutting speed, not feed
	Extreme L/D ratio	Shorten tool to increase stiffness
		Increase holding arbor's and intermediate's OD
		Use Steadyline bar
		Use carbide or heavy metal extensions
	Too large insert radius	Use insert with smaller radius
	Unstable workpiece	Improve fixture and clamping support
	Lead angle κ is 80°	Change to κ=90°, type CC insert
Insert chipping or breaking	Wrong insert	Change to tougher grade of insert
		Use larger radius if available
	Severe interrupted cut	Decrease speed, decrease feed
	Chips packing and re-cutting	Check for boring bar/bore diameter clearance
		Improve chip control, increase feed
Poor tool life	Wrong insert	Change to higher wear resistant grade
	Excessive cutting speed	Reduce speed
	Insert chipping	Check DOC and feed rate
	Too low coolant pressure	Increase coolant pressure
Chips not evacuating	Boring assembly to large	Reduce to a smaller head with extended insert holders when possible
	Excessive DOC	Use staggered method; prefer CC.. instead of CN.. inserts (particularly when using the boring head at its small diameters).
	Inadequate space below bore	Set the workpiece higher onto the table
	Poor chip control	See above
Insufficient machine power	Excessive feed rate	Reduce feed (not less then 25% of insert radius)
	Excessive DOC	Use staggered method
	Low machine power	RPM in area of low spindle torque: increase speed
		RPM in area of gear change: adjust RPM
		Change insert to higher rake angle (to HSS in extreme cases)
		Reduce DOC
Excessive hole exit burr	Excessive feed rate	Reduce feed
	CC type insert holders 90°	Use 80° square insert holder
	Cutting forces too high	Reduce DOC
		Reduce insert radius

RB 610 Rough boring heads – Overview

Ø 86–116 mm *(Ø 3.386–4.567")*

RB 610 Rough boring heads – Guide

Features

- A rough boring head assembly is a combination of 1 body (head) and 2 insert holders
- Achieving geometrical hole precision starting from cast, flame cut or drilled hole
- Minimised unbalance thanks to a symmetrical design

Compact

- Short body to maximise the rigidity of the boring assembly and to deliver the best damping performances when used on Steadyline® turning and boring bars
- Reduced weight for fast tool changing and spindle acceleration

Intuitive and fast setting

- Each insert holder features its push and pull setting mechanism allowing easy and fast setting of the diameter, using a pre-setter
- Diameter scales roughly visualise the insert holders positions

Insert holders

- A610…CC… insert holders achieve a 90° lead angle for rhombic inserts, 0° rake angle and 0° inclination angle
- The insert holders are suitable for both RB 610 Graflex® and RB 610 GL heads

Productivity

- High rigidity resulting from a tight fitting of the insert holders into the head's body, and large clamping screws
- Possibility to take a depth of cut ap up to half of the insert's width, maximising the chip removal rate and allowing a total exploitation of the inserts
- Staggered boring using a shim (part of heads delivery contents) to offset one insert holder in order to increase or to split the radial depth of cut
- Through coolant delivery directed towards the cutting edges

Product range

- RB 610 rough boring heads are available with Graflex® machine side connection, for conventional boring operations up to 6xD overhangs
- RB 610 rough boring heads with GL and BA machine side connections are designed for longer overhangs with vibration damping Steadyline® assemblies.

RB 610 Graflex®

- Graflex®: 4 compact rough boring heads for Ø 39–115 mm *(Ø 1.535–4.528 ")*
- The flexible Graflex® modular System allows to build up optimal boring assemblies from Graflex® adapters, intermediate modules and boring heads

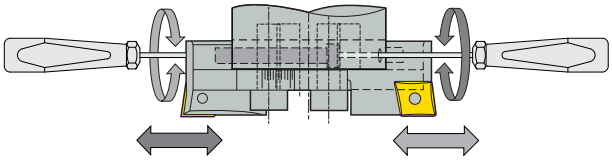
RB 610 GL and BA, for Steadyline® vibration damping bars

GL

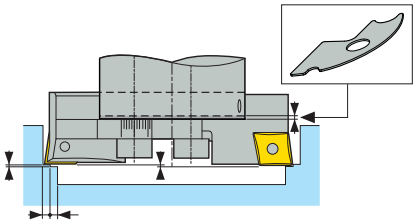
BA

- GL: 4 short and compact rough boring heads, for Ø 28–69 mm *(Ø 1.102–2.717 ")*
- BA: 2 short and compact rough boring heads, for Ø 66–116 mm *(Ø 2.598-4.567")*
- Particularly adapted to the Steadyline® turning and boring bars. Boring performances, when used on long Steadyline® bars, are similar to non-damped shorter assemblies (<6xD).

RB 610 Rough boring heads – Guide



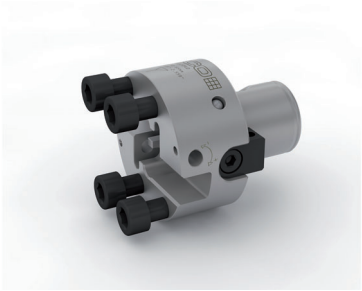
Setting symmetrical boring:



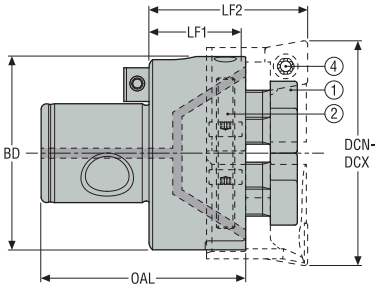
Symmetrical boring means both cutting edges are set on the same diameter and same height.

Setting staggered boring:

Staggered boring means one cutting edge is offset as a leading cutting edge (entering the bore first), operating on a smaller diameter than the second edge set on the diameter to be realized: It requires a shim (part of the head delivery content) to be fitted between the boring head's body and one insert holder to achieve the (+) axial offset, see table below.

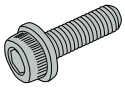


Shim Part No.	Thickness (mm)	*Thickness (inch)*
AU6101003	0,2	*0.008*
AU6103003	0,4	*0.016*
AU6104003	0,5	*0.020*
AU6105003	0,6	*0.024*
AU6106003	0,6	*0.024*



RB610

Graflex®



- Symmetrical and staggered boring modes are possible
- Individual insert holder adjusting mechanism
- Internal coolant supply towards cutting edge

RB 610 Rough boring heads – Instructions

Recommended tightening torques. Maximum feed per rev. when staggered.

RB 610 boring heads size	30	40	50	60
Tightening torque of clamp screws for insert holders clamping (Nm)	2 x 25	4 x 25	4 x 40	4 x 40
f Max. feed rate when staggered boring mm/rev *(in/rev)*	0,4 *(0.016 “)*	0,5 *(0.020 “)*	0,6 *(0.024 “)*	0,6 *(0.024 “)*

Recommended machining conditions Spindle power:

As rough boring requires high machine power, we recommend to check that the machine is suitable. Staggered boring is a solution to reduce the power needs, as the feed is divided by two for the same total depth of cut, compared to symmetrical setting. Optimum performance is obtained with through coolant (higher machining data, better surface finish, better chip evacuation, longer insert life).

For detailed user instructions, please refer to the operating instructions supplied as part of the delivery content of the boring heads and with the Steadyline® bars. These operating instructions can also be downloaded from www.secotools.com.

Maximum speeds for RB 610 rough boring heads

NOTE! The maximum speeds shown in boring heads Product pages are related to the boring head’s mechanical design and balancing quality.

Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. workpiece material, cutting edge (insert), tooling length, machine spindle.

By boring applications with Steadyline® bars, make sure not to overpass the max. RPM of the bars : See the Operating instructions supplied with the Steadyline® turning and boring bars.

Fine boring

Covering a wide range of hole sizes and materials, Seco's fine boring product families allow for precision adjustments within microns, achieve surface finishes of Ra <1 (RMS 44 micro/inch) and deliver bores within IT5 tolerances. With a consistent focus on precision and rigidity, these products make it easy to maintain even the strictest of part specifications. Steadyline™ vibration damping solutions complete the range to deliver even greater levels of stability for the machining of deep cavities, where long tool overhangs are needed.

- FB 760 Axiabore Digital and Analog boring heads are designed for precision and surface finish on small diameters
- Our range of Axiabore™ fine boring heads now also includes the Digital version, which makes the operator's life easier and reduces the frequency of human errors. The Digital version helps easier and faster set-ups with good process reliability and efficiency in fine boring on high-tolerance parts
- FB 620/780/790 radial fine boring heads are designed to deliver the best bore geometries on larger diameters (up to 205 mm)

Digital fine boring heads Axial type

The digital Axial fine boring heads provide excellent results for boring operation (IT5 achievable). It replaces the use of an analogic vernier by a removable, universal digital display: when the vernier of a conventional, analogic boring head is not always easy to use for diameter adjustment on the machine, the large display screen of the FB 760 D series allows comfortable and reliable diameter adjustments.

The FB 760 D series revolutions the boring philosophy, as it eliminates the need of a presetter: all the presetting and adjusting operations are made directly on the machine, using the universal digital display controller.

Boring tools
Boring tools, solid carbide shank Ø 4 mm for the smallest diameters Ø 2–108 mm (Ø 0.079”–4.252”), lead angle 98°. The tools have an angled machine side for cutting-edge orientation according to ISO.

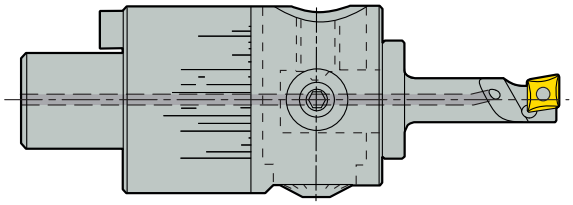
Storage box
The Digital display come with a unique and sustainable packaging box.

Features

Universal digital display, for FB 760 D fine boring heads
The universal digital display controller can be used for any number of boring heads. Featuring a large display screen, can be used in mm or inch value.

The universal digital display has been designed to make your life easy:

- Wide display screen to facilitate the reading - resolution of 1 µm.
- An intuitive and easy-to-use system, easy to switch between.
- Self-holding controller: once it has been connected to the boring head, the controller remains in place and lets the operator free to use both hands to perform the diameter setting.
- One universal digital display for any number of boring heads. Delivered with a USB wire, the universal digital display can be power charged on the USB port of your machine or computer.



Axiabore™ type fine boring heads for bores Ø 0,3-108 mm *(0.012-4.252")*

Axiabore™ type head selection	Capacity ∅ mm	*Capacity Ø inch*	HSM/ Max speeds	Digital	Balanceable	Hole geometry	Cost effective

2 Axiabore™ fine boring heads FB 760 with Seco-Capto™ connection for bores: Ø 2–108 mm *(0.079–4.252")*

Axiabore™ – C3-391.0760-02
Axiabore™ Plus – C5-391.0760-03
Digital Axiabore™ – C3-391.FB760-02-D
Digital Axiabore™ Plus – C5-391.FB760-03-D

NOTE! The minimum bore size of the smallest Seco-Capto™ fine boring head is Ø 2 mm *(0.079")* with the smallest available Seco-Capto™ C3 connection. For Ø 0,3-8 mm *(0.012-0.315")* use Nanobore™ head with connection size G2 in conjunction with the appropriate Seco-Capto™/Graflex® adapter.

Seco-Capto™ adapter and Graflex® head: Ø 0,3–8 mm *(0.012–0.315")*

Graflex® and Seco-Capto™ adapters and modular extensions: please see the Tooling Systems catalog.

NOTE! Features, instructions (tool fitting procedure, diameter setting, MPA assembly procedure, maximum speeds, recommended cutting speeds, troubleshooting), suitable tools and insert holders are similar for both types of 760 fine boring heads of similar boring capacity size, regardless of connection type.

Digital display for digital fine boring heads

Boring tools

Note! In the Product pages, it is clearly mentioned which tools are suitable for which heads.

Boring tools, solid carbide shank Ø 4 mm *(Ø 0.1574")* for the smallest diameters Ø 0,3–6,2 mm *(Ø 0.012–0.244")*, lead angle 98°. Require reduction bushes to fit into Nanobore™ and Axia(libra)bore™ heads. The tools have an angled machine side for cutting edge orientation according to ISO.

Boring bars, insert type shanks Ø 6, 12 or 16 mm *(Ø 0.236, 0.472, 0.630")* for Ø 6–13 mm *(Ø 0.236–0.512")*, 'steel' type for short tools, 'carbide' type for long tools. For WB..0301.. or CC..0602.. inserts and 90° lead angle. Direct fitting into the heads. The locking flat achieves a cutting edge orientation according to ISO.

Boring bars, modular composed of a 'shank' and an 'insert holder' for Ø 13–63 mm *(Ø 0.512–2.480")*. Shanks Ø 12 or 16 mm *(Ø 0.472, 0.630")* in 'steel' for short, 'carbide' for long and 'Lightweight / aluminium' for the largest diameters. Direct fitting into the heads.

Six insert holders for CC..0602.. inserts and 90° lead angle, compatible with all shanks to build up a wide boring capacity on a common shank.

Multi-purpose adapter (MPA)

MPA for boring and OD-overturning, as well as face grooving on the - Axiabore™ Plus - head. The MPA and tools have a serrated interface, for precise orientation and positioning increments 2,5 mm on diameter *(0.098")*. Directional through coolant nozzle included.

Select the components to build up an MPA type tool on the MPA tool selection charts. See assembly details in the Instructions chapter.

Set up a Boring or OD-overturning assembly.
Boring and OD-overturning assemblies use the same shank equipped with an insert holder, and a counterweight. Boring assembly: Select the appropriate insert holder to be assembled onto the boring/OD-overturning shank, using the selection chart 'Boring with MPA' (part of following Product pages).

OD–overturning assembly: Select the appropriate insert holder to be assembled onto the boring/OD-overturning shank, using the selection chart 'OD-overturning with MPA' (part of following Product pages). See assembly details in the Instructions chapter.

Building a grooving assembly

A grooving assembly requires:

- A pair of grooving tool holders (one E='External' and one I='Internal')
- One grooving tool 'against Spigot' or 'against Bore'.When the groove is not against a spigot wall nor against a bore wall, both tool types are suitable. See the selection charts 'Grooving tool for grooving with MPA'

Features

Nanobore™ head, Part No. A76001

Ultra small head for fine boring Ø 0,3–8 mm *(Ø 0.012–0.315")*:
External diameter 25 mm *(0.984")*, length 25 mm *(0.984")*, with Graflex® connection size G2, tool fitting Ø 6 mm *(Ø 0.236")*.
Operating speeds up to 30 000 RPM allows performance machining of very small diameters.

The reduction bush 6–4 mm *(0.236–0.157")* with orientation flat and pin for fitting the solid boring tools is part of the head delivery content.

Diameter setting resolution: 2,5 µm *(0,0001")*

Axiabore™ head, Part No. A76002

Small heads for fine boring Ø 2–20 mm *(Ø 0.079–0.787")*:
External diameter 36,5 mm *(1.401")*, length 32 mm *(1.260")*, with Graflex® connection size G3 and Seco-Capto™ connection size C3, tool fitting Ø 12 mm *(Ø 0.472")*. These heads sizes are optimised for difficult-to-access bores.

The reduction bush 12-4 mm *(0.472–0.157")* with orientation flat and pin for fitting the solid boring tools is part of the head delivery content.

NOTE! Smaller tools from Nanobore™ 0,3–2,1 mm *(0.012–0.083")* can also be fitted, but the machining speed will be limited to 12000 RPM: Nanobore® head should be preferred.

Diameter setting resolution: 2,5 µm *(0,0001")* on diameter for analog heads, 1 µm *(0,00004")* on diameter for digital heads

Axiabore™ Plus - head, Part No. A76003 and C5-391.0760-03

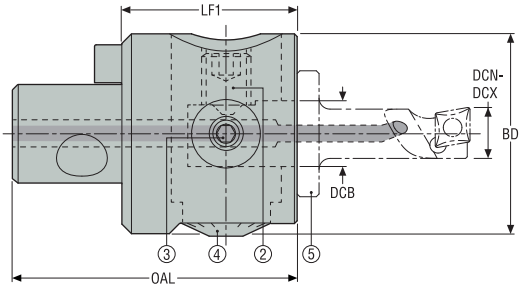
Multi-purpose heads for fine boring Ø 6–108 mm *(Ø 0.236–4.252")*, OD-overturning Ø 2–57 mm *(Ø 0.079–2.244")* and grooving Ø 19–96 mm *(Ø 0.748–3.780")*:
External diameter 54 mm *(Ø 2.126")*, length 45 mm *(Ø 1.772")*, with Graflex® connection size 5 and Seco-Capto™ connection size 5, tool fitting Ø 16 mm *(Ø 0.630")*.
Suitable tools: all tools with shank Ø 16 mm *(Ø 0.630")*, for direct fitting into the heads.

This head has also been designed to be equipped with the MPA (multi-purpose adapter), to perform large diameter fine boring, OD–overturning and face grooving.

Diameter setting resolution: 2,5 µm *(0,0001")* on diameter for analog heads, 1 µm *(0,00004")* on diameter for digital heads

Axialibrabore™ Plus - head, Part No. A76013

Balanceable head for fine boring Ø 6–33 mm *(Ø 0.236–1.299")*:
Same features as the - Axiabore™ Plus - head, but with fine balancing body length 65 mm *(2.559")*.
With Graflex® connection size G5.
Fine balanceable heads allow higher speeds up to 20 000 RPM or 1500 m/min (whichever is reached first without exceeding either of them), improve the hole geometry and reduce the machine spindle stress.
'LibraOne' balancing is performed by setting the graduated balancing ring in line with the mark on the boring head (balancing code of the tool used, and the diameter to be bored). No chart needed.
Fine balancing is only possible for the smallest boring tools Ø 6–33 mm *(Ø 0.236–1.299")*.



NOTE! If using a larger 'Alu', or a 'MPA' tool from the - Axiabore™ Plus - onto the - Axialibrabore™ Plus - head, fine balancing is not possible and the balancing ring should be set in the head's pre-balancing position (depending on the operation to be performed, see Instructions chapter).
The maximum speed becomes the same as for the - Axiabore™ Plus.

Diameter setting resolution: 2,5 µm *(0,0001")*

FB 760 – Axiabore™ type heads, not balanceable

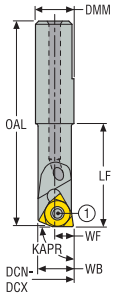
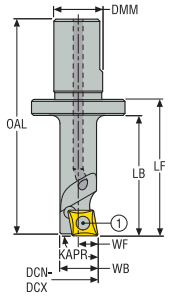
*These tools with shank dia 4 mm require the use of a reduction bush, delivered with the suitable heads and kits.

** For cutting speeds, see page(s) 686-689



***+0,1 mm complementary capacity achievable.

Boring bars, insert type



for FB 760 heads

A

B

1 = Insert screw

- Suitable for both Digital and Analog boring heads
- Cutting edge orientation ISO
- Through coolant
- Only two insert sizes for all tools
- Tool material * = Steel, indexable insert type
- Tool material ** = Carbide, indexable insert type
- KAPR 90°

Boring shanks, for modular fine boring bars

for FB 760 heads

B

A

1 = Locking screw

- Several capacities achievable by interchangeable insert holders
- Shank types 'steel' for short bars, 'carbide' for long bars, 'aluminium' for large bars
- Through coolant

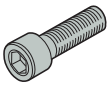
For larger diameters, see Multi-purpose adapter (MPA) section.
* When used on A760 13, no fine balancing possible.

Multi-purpose adapter (MPA)

for FB 760 heads



- Suitable for both Digital and Analog Axiabore™ Plus – A760 03 head only*
- Designed to hold a shank and a counterweight (for boring or OD-overturning) or two grooving tool holders (for face grooving)
- Through coolant with an adjustable nozzle (3)

1. Assembly screw
2. Washer
3. Adjustable nozzle

Detailed description of insert holders, see page(s) 624

Inch Selection chart:
Boring tools and insert holders suitable for FB 760 heads

Select a suitable insert holder and note the shank position on the MPA to obtain the required bore capacity.
Note: A boring assembly requires:
- an - Axiabore™ Plus - head (A760 03)
- a MPA (BDA16BS25100)
- a shank (BAS25MH1660)
- a counterweight (BAS25CW1660).
- an insert holder (A765R.) to be selected in the chart
- an insert

Detailed description of insert holders, see page(s) 624

Metric Selection chart:
Insert holders for OD-overturning with MPA, for FB 760 heads

Select a suitable insert holder and note the shank position on the MPA to obtain the required bore capacity.
Note: A OD-overturning assembly requires:
- an - Axiabore™ Plus - head (A760 03)
- a MPA (BDA16BS25100)
- a shank (BAS25MH1660)
- a counterweight (BAS25CW1660).
- an insert holder (A765R.) to be selected in the chart
- an insert

Inch Selection chart:
Insert holders for OD-overturning with MPA, for FB 760 heads

Select a suitable insert holder and note the shank position on the MPA to obtain the required bore capacity.
Note: A OD-overturning assembly requires:
- an - Axiabore™ Plus - head (A760 03)
- a MPA (BDA16BS25100)
- a shank (BAS25MH1660)
- a counterweight (BAS25CW1660).
- an insert holder (A765R.) to be selected in the chart
- an insert

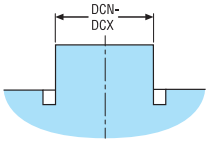
Metric Selection chart:
Grooving tool -against spigot- for grooving with MPA, for FB 760 heads

Assembly case 1



Assembly case 2

Select the suitable grooving tool, and note the grooving tool holder position on the MPA to obtain the required groove capacity.

Note: An -against spigot- grooving assembly requires:

- an - Axiabore™ Plus - head (A760 03)
- a MPA (BDA16BS25100)
- an I (internal position) and an E (external position) grooving tool holder (BAS25FGI35 and BAS25FGE35) to either hold a grooving tool or act as a counterweight (see setting position in the chart)
- an -against spigot- grooving tool (AFG...82) to be selected from the chart, related to groove width and diameter.

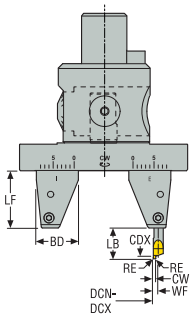
Detailed description of the grooving tools, see page(s) 629



Metric Selection chart:
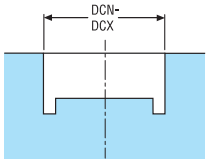
Grooving tool -against bore- for grooving with MPA, for FB 760 heads

Assembly case 3



Assembly case 4

Select the suitable grooving tool, and note the grooving tool holder position on the MPA to obtain the required groove capacity.

Note : An -against bore- grooving assembly requires:

- an - Axiabore™ Plus - head (A760 03)
- a MPA (BDA16BS25100)
- an I (internal position) and an E (external position) grooving tool holder (BAS25FGI35 and BAS25FGE35) to either hold a grooving tool or act as a counterweight (see setting position in the chart)
- an -against bore- grooving tool (AFG...81) to be selected from the chart, related to groove width and diameter.

Detailed description of the grooving tools, see page(s) 629

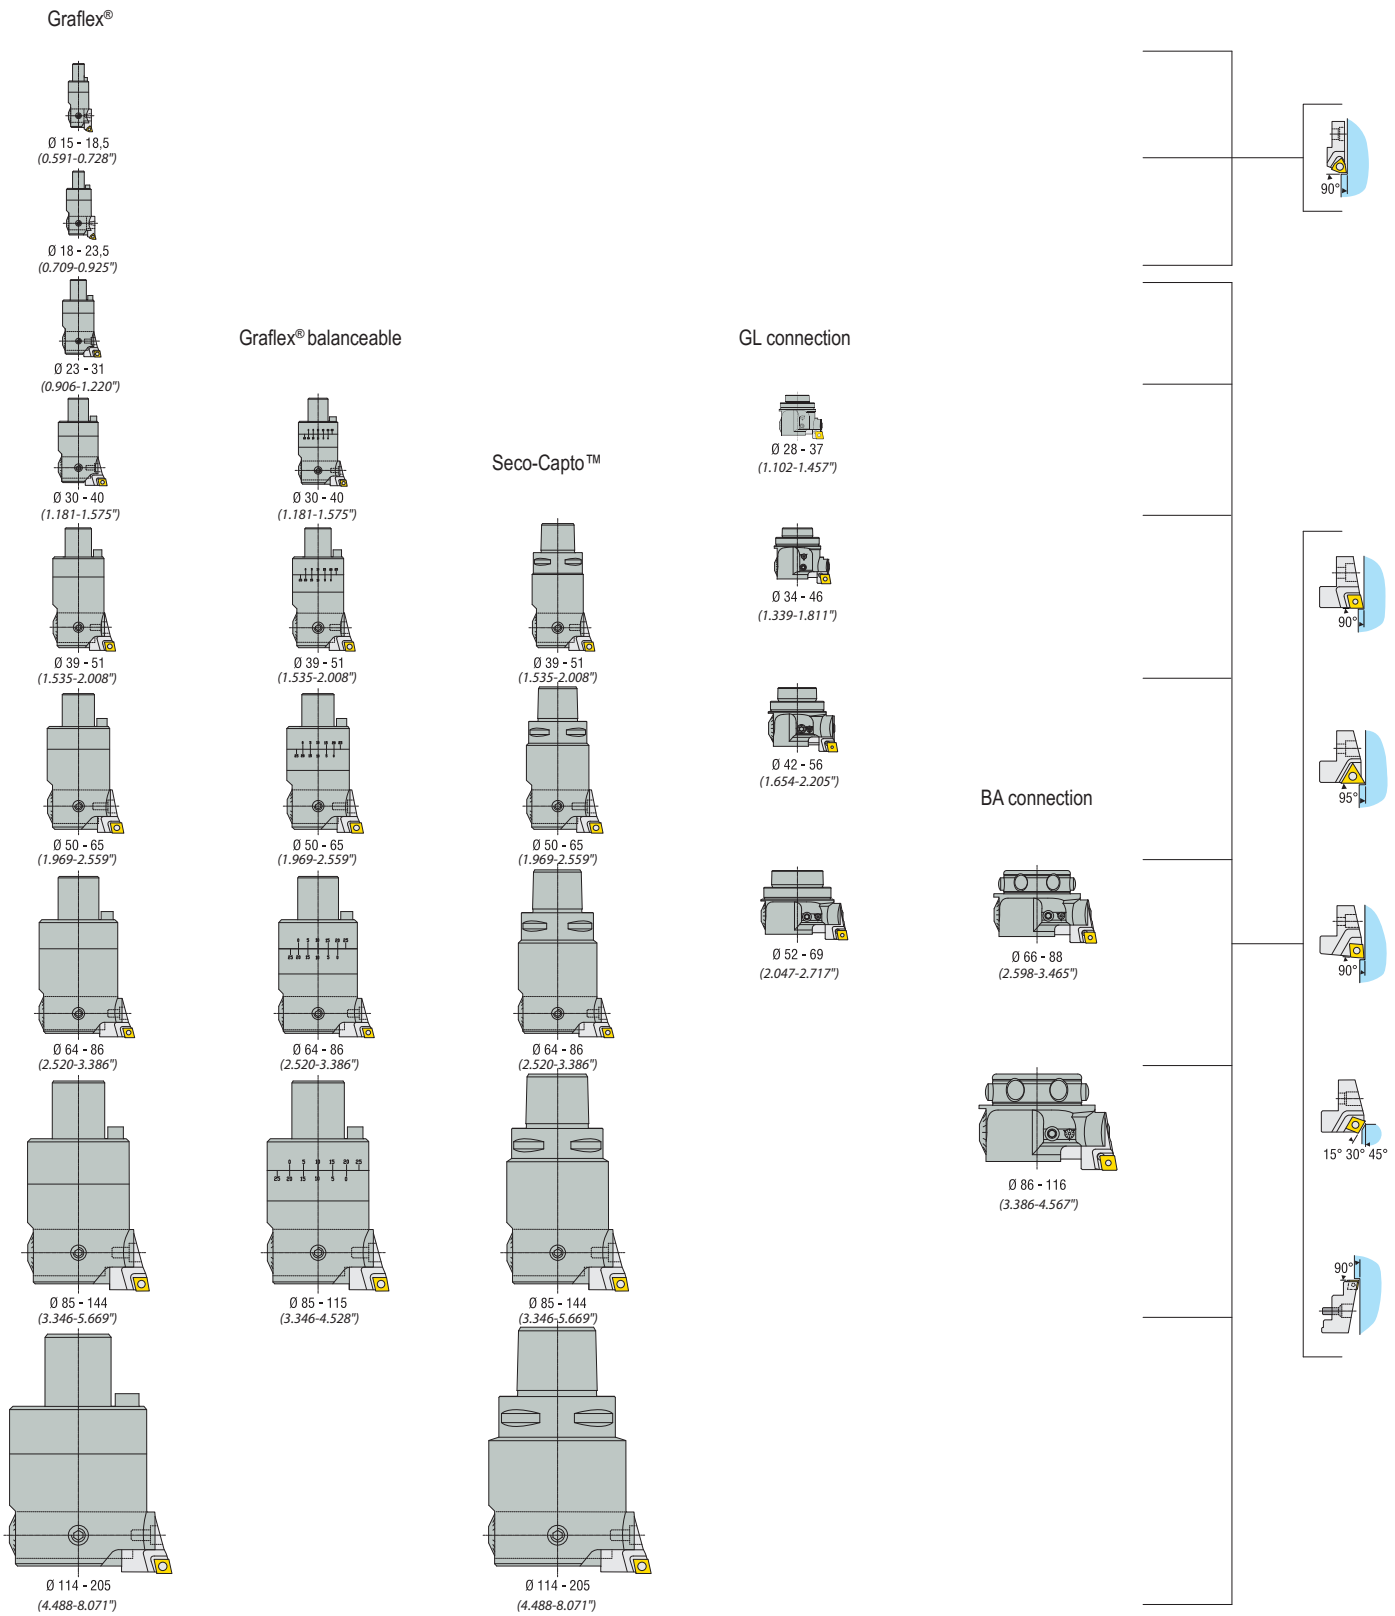
Instructions
Maximum speeds for Axiabore™ type heads



For further application details refer to the operating instructions supplied with the boring heads and with the GL bars.					
Head	**Capacity ∅ mm** *(inch)*	**Max. RPM with tool (RPM)**	**Max. RPM with MPA (RPM)**	**Max. cutting speed v_c at min. Cap. m/min** *(sf/min)*	**Max. cutting speed v_c at max. Cap. m/min** *(sf/min)*
Axiabore™ type with Graflex® connection					
A76001	0,3-8 *(0.0118-0.315)*	30000	–	28* *(92*)*	754* *(2474*)*
A76002	2-20 *(0.0787-0.787)*	12000	–	75* *(246*)*	754* *(2474*)*
A76003	6-108 *(0.236-4.25)*	8000**	5000	151* *(495*)*	1000*** *(3281***)*
A76013	6-33 *(0.236-1.30)*	20000**	5000	377* *(1237*)*	1500*** *(4921***)*
Axiabore™ type with Seco-Capto™ connection					
C5-391.0760-03	6-108 *(0.236-4.25)*	8000*	5000	151* *(495*)*	1000** *(3281**)*

Note: The maximum speeds are related to the boring head's mechanical design and balancing quality. Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. workpiece material, cutting edge (tools and inserts), tooling length, machine spindle. At speeds from approx. 8000 RPM and above, the holding arbors and intermediates should be fine balanced. Using balanceable heads and fine balanced holders improves the tool life and the boring performances even at lower speeds.
* Implied max. cutting speed with max. RPM.
** Not reachable with all tools, see ***.
*** Max. cutting speed not to be exceeded

Troubleshooting instructions (also valid for Radial type fine boring heads)

Problem	Possible cause	Solution
Poor tool life	Wrong insert grade	Change to more wear resistant grade
	Excessive cutting speed	Reduce cutting speed
	Excessive DOC	Decrease DOC
Chatter & Vibrations	Excessive cutting speed	Reduce cutting speed
	High L/D ratio	Shorten tool to increase stiffness
		Use stronger boring tool
		Use Steadyline bar
		Use carbide or heavy metal extensions
	Wrong insert	Reduce nose radius of insert
		Use ground geometry inserts
	Incorrect stock allowance	Change pre-hole diameter
Poor hole diameter tolerance & repeatability	Inaccurate tool changes	Worn and damaged tool shank: replace
		Clean spindle and tool shank
	Variation of stock allowance	Add semi-finishing boring step
	Low spindle stability	Use sharper ground geometry inserts
Poor roundness	Excessive boring tool imbalance	Check the spindle runout
		Change to LIBRAFLEX® boring head
		Check balance ring setting
		Reduce speed
	Excessive cutting forces	Check stock allowance and feed rate
	Insufficient workpiece clamping	Check for uniform workpiece clamping
	Workpiece non-symmetrical	Reduce cutting forces, change to ground insert
		Increase cutting speed, reduce feed
Poor positional tolerance	Original bore misaligned	Add a semi-finishing boring step
	Excessive DOC	Decrease DOC, make two passes
Poor surface finish	Wrong insert radius	Use larger insert radius
	Excessive feed rate	Reduce feed to be max. 30% of insert nose radius
	Poor chip evacuation	Apply through coolant
		Change insert to higher rake angle (HSS: please enquire)
		Check DOC
Tapered bore	Premature tool wear	Change to more wear resistant grade
		Modify cutting speed
		Increase coolant flow

Fine boring heads – Guide

Features

A radial type fine boring head is an assembly of a body (head) and an insert holder. FB 620, FB 780 and FB 790 radial, fine boring heads feature:

Product range

Seco offers a variety of radial fine boring heads to fulfill all your needs with the most suitable solution:

FB 620, FB 780 and FB 790 radial, fine boring heads

- Micrometric adjustment: Insert holder setting mechanism with a micrometric adjusting screw, 1 increment = 0,01 mm *(0.0004")* on the diameter and a vernier scale, resolution of 2,5 µm *(98.4 µin)* on the diameter
- The precision of the mechanism guarantees repeatable accuracy
- Angular orientation of the cutting edge according to DIN 69871/ISO 7388 for SA and ISO 12164 for HSK
- Coolant through the head directed towards the cutting edge
- FB 780 and FB 620 boring heads are pre-balanced on median diameter setting. FB 790 are balanceable, for optimized performance.

Note: Features, Instructions (insert holder fitting, diameter setting, back boring instructions, troubleshooting, recommended machining conditions, maximum speeds), suitable insert holders and suitable inserts are identical for all types of FB 620, FB 780 and FB 790 fine boring heads of similar boring capacity size, regardless of their machine side connection types.

FB 620 Fine boring heads, radial types, for Steadyline® vibration damping bars

GL

BA

- 4 fine boring heads with GL machine side connection for fine boring Ø 27–69 mm *(Ø 1.102–2.717")*
- 2 fine boring heads with BA machine side connection for fine boring Ø 66–116 mm *(Ø 2.598–4.567")*

Their compact design achieves best damping performances when used on Steadyline® GL turning and boring bars.

FB 780 Fine boring heads, radial types

9 precision boring heads with Graflex® machine side connection for fine boring ∅ 15-205 mm *(Ø 0.591–8.071")* using radially fitted insert holders.

5 precision boring heads with Seco-Capto™ machine side connection for fine boring Ø 39–205 mm *(Ø 1.535–8.071")*.

Seco-Capto™ adapter and Graflex® head: ∅ 15-40 mm *(Ø 0.591– 1.575")*.

Note: The minimum bore size of the smallest Seco-Capto™ fine boring head is ∅ 39 mm *(Ø 1.535")* with the smallest available Seco-Capto™ C3 connection. For ∅ 15-40 mm *(Ø 0.591–1.575")* use Graflex® boring heads with connection sizes G0 to G2 in conjunction with the appropriate Seco-Capto™/Graflex® adaptor. This offers also boring length modularity when using additional Graflex® extensions.

Note: Features, Instructions (insert holder fitting, diameter setting, back boring instructions, troubleshooting, recommended machining conditions, maximum speeds), suitable insert holders and suitable inserts are similar for both types of FB 780 fine boring heads of similar boring capacity size, regardless of connection type.

FB 790 Balanceable fine boring heads, radial type

5 balanceable 'Libraflex®' boring heads with Graflex® machine side connection for fine boring ∅ 30-115 mm *(Ø 1.181–4.528")*, at high speeds, up to 1500 m/min *(4921 sf/min)*, using radially fitted insert holders.

Balancing reduces spindle stress, cutting parameters can be optimized, better machining qualities are achieved even at conventional speeds.

Balancing is performed by setting both graduated rings in accordance with the diameter to be bored (no chart needed).

Features

Insert holders

A radial type fine boring head is an assembly of a body (head) and an insert holder.

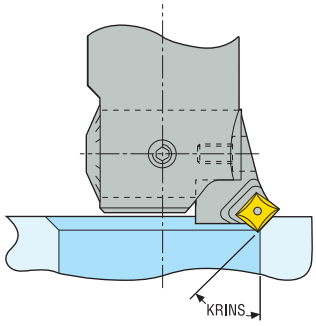
The wide range of fine boring, chamfering and back boring insert holders are suitable for FB 620, FB 780 and FB 790 fine boring heads, radial types.

Fine boring insert holders

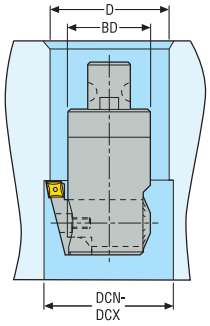
FBIH 782: lead angle 90° for WB inserts
FBIH 724: lead angle 90° for TC inserts
FBIH 725: lead angle 90° for CC inserts
FBIH 726: lead angle 95° for CC inserts

Note: 95° lead angle insert holders should be used to avoid face contact when boring up a shoulder.

Chamfering insert holders, ∅ 23 to 160 mm *(Ø 0.906–6.299")*



FBIH 729: available with a 15°, 30° or 45° lead angle for CC inserts.

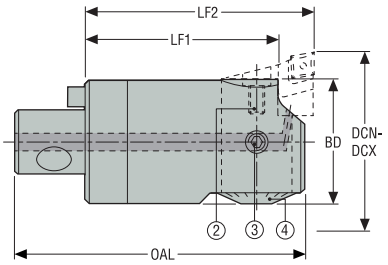


Libraflex® balancing can also be achieved when using chamfering insert holders.

Back-boring insert holders, ∅ 26,5 to 164 mm *(Ø 1.043–6.457")*

FBIH A789: lead angle 90° for WB and CC inserts.

Libraflex® balancing is not possible when using back-boring insert holders. In this case, the highest unbalance reduction is obtained when both balancing rings are set on their largest graduation.



FB780

Graflex®

- With micrometric adjusting (increment 0,01 mm and vernier 2,5 µm, on the diameter)

FB 780/ 790 Fine boring heads – Instructions

Recommended machining conditions
For further application details refer to the operating instructions supplied with the boring heads and with the GL bars.

Maximum speeds for fine boring heads, radial type
The maximum speeds shown in boring heads Product pages are related to the boring head's mechanical design and balancing quality. Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. workpiece material, cutting edge (insert), tooling length, machine spindle.
By boring applications with Steadyline® bars, make sure not to overpass the max. RPM of the bars: See the Operating instructions supplied with the Steadyline® bars.
Below max. RPM are for boring heads equipped with boring insert holders or chamfering insert holders. When using back boring insert holders on holders on FB 620, FB 790 or FB 780 heads type heads, use max. RPM for A780.. type, similar size.

Head	Capacity ∅ mm *(inch)*	Max. RPM	Implied max cutting speed v_c at min. Cap. m/min *(sf/min)*	Implied max cutting speed v_c at max. Cap. m/min *(sf/min)*

	159-205 *(6.260-8.071)*	1600	799 *(2621)*	1030 *(3379)*

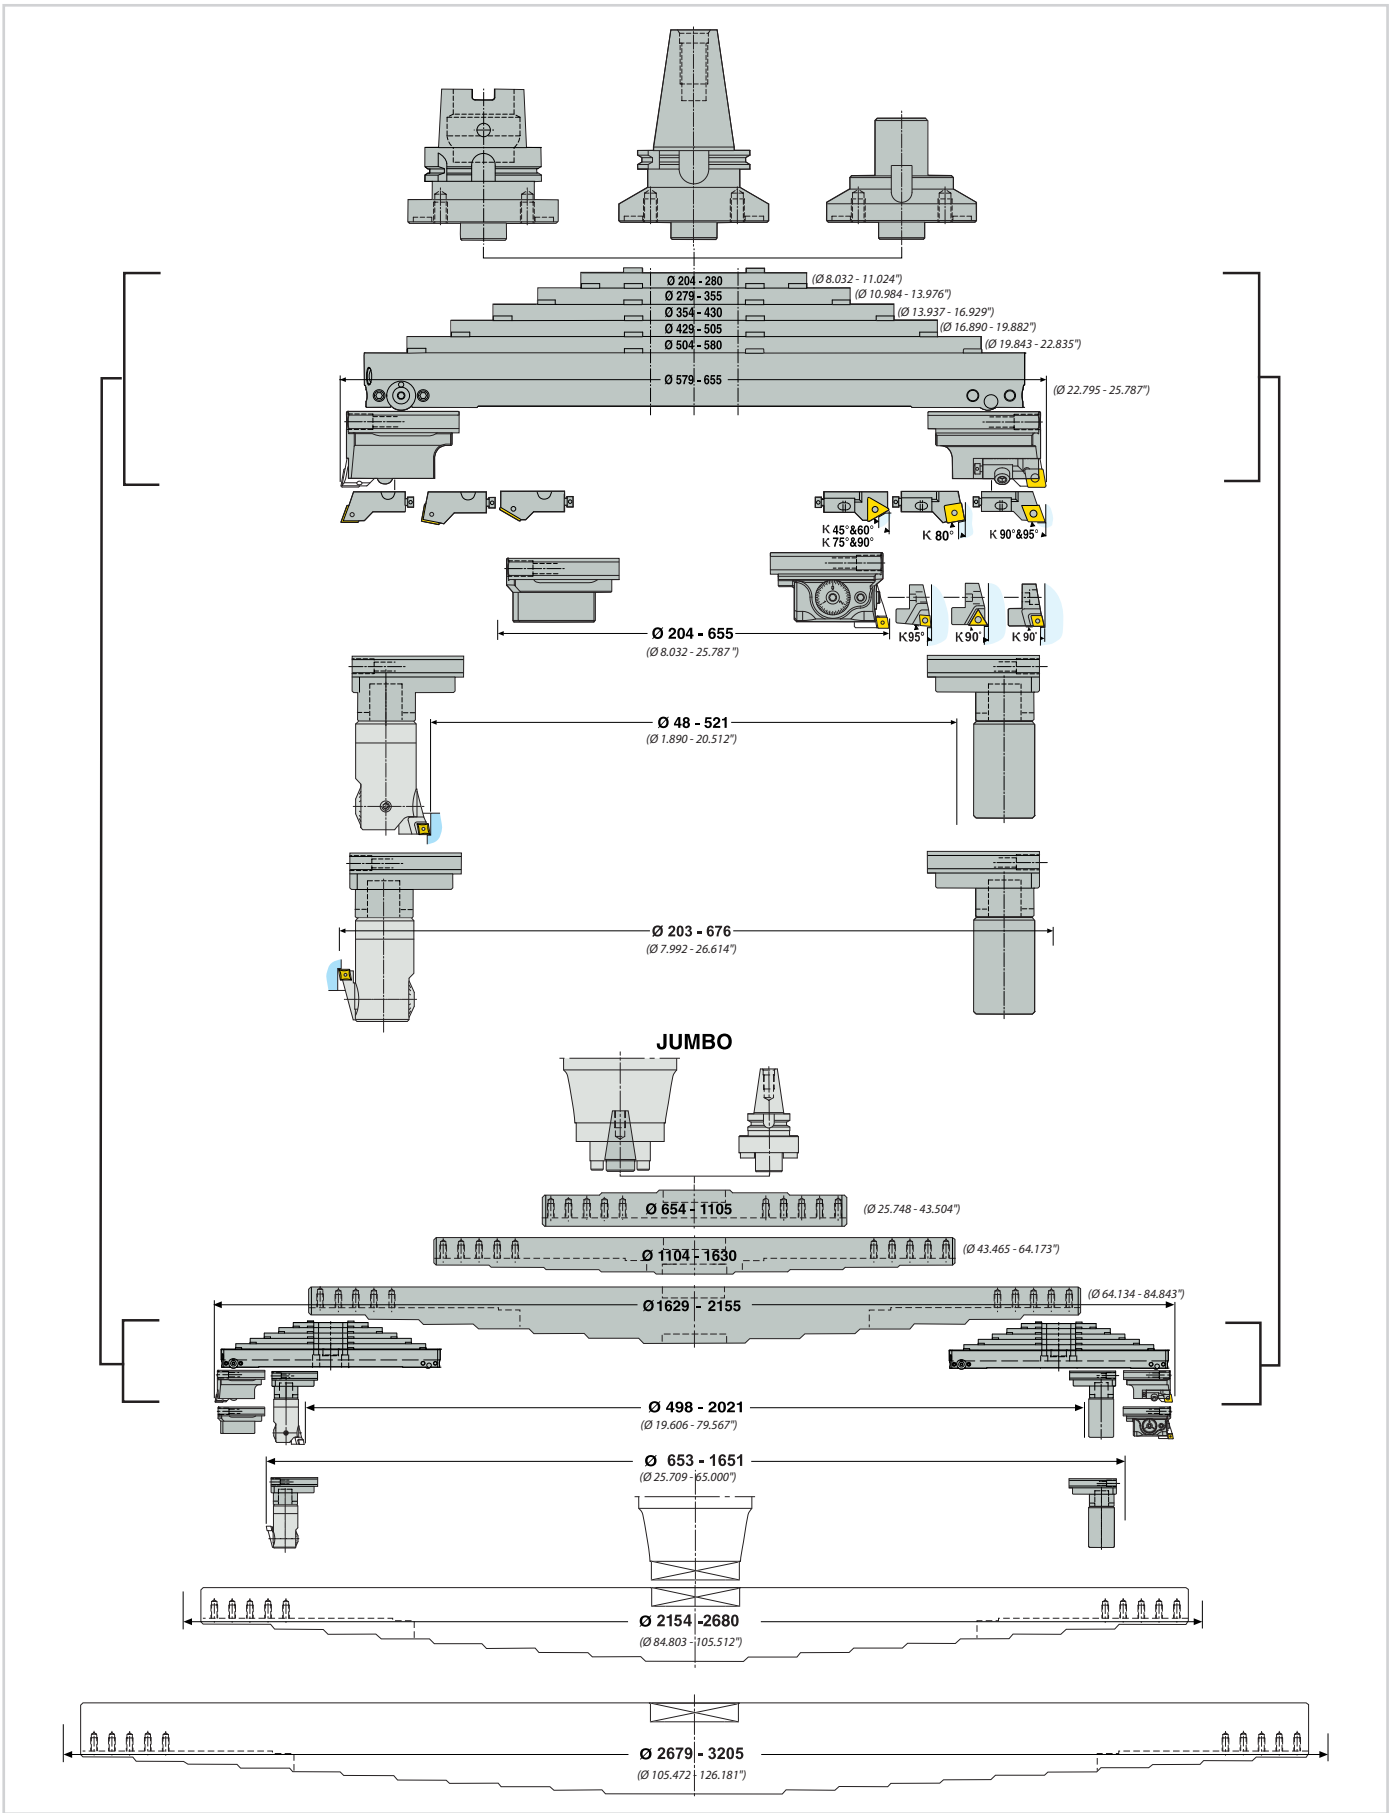
Note: The maximum speeds are related to the boring head's mechanical design and balancing quality. Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. workpiece material, cutting edge (insert), tooling length, machine spindle. At speeds from approx. 8000 RPM and above, the basic holders and the extensions/reducers should be fine balanced.



Bridge bars

Seco offers a complete range of Bridge Bars and Jumbo Bridge Bars for large diameter boring and overturning operations.

- Designed for maximum flexibility, Bridge Bars are available in a large range of diameters as standard products, covering a diameter range of 204 - 655 mm (8.03 - 25.78 inch)
- Seco Jumbo Bridge Bars are made of high tensile aluminum with steel interfaces, and cover the 654 - 2155 mm (25.75 - 84.843 inch) diameter range

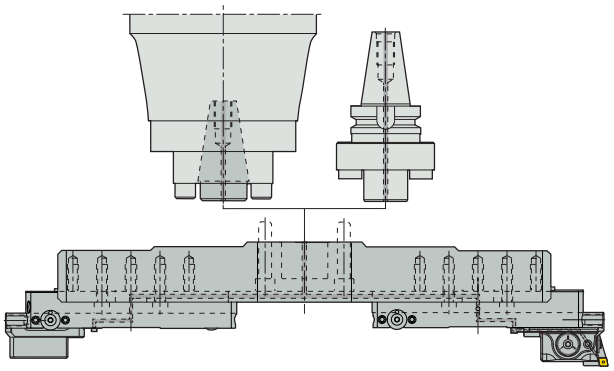
Features

5 Bridge bars for boring

Ø 654–3205 mm *(Ø 25.748–126.181")*, **also OD-overturning Ø 498–3071 mm** *(Ø 19.606–120.906")* **and back-boring Ø 653–3226 mm** *(Ø 25.709–127.008")*.

Jumbo Bridge bars made of high tensile aluminium with spindle steel interfaces, are designed to hold two classic Bridge bars in several positions.



Sizes A731S001, 002, 003 are delivered with 4 locking screws to be fitted onto a milling cutter holder, flange mounting Type 569, spigot Ø 60 mm *(Ø 2.362")* - or to be fitted directly onto the machine spindle (DIN 2079/50 workpiece side), using the centering spigot shown in accessories. Jumbo Bridge bars are delivered with two lifting rings.

Sizes A731S004-...* and A731S005-...* are available on request, with standard or specific spindle fitting possibilities, according to the machine:

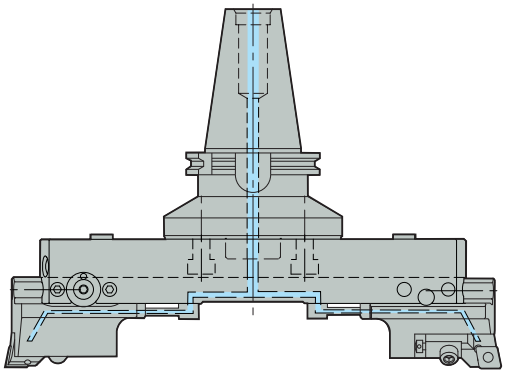
Main features Jumbo Bridge bars

The Jumbo Bridge bars 'S' feature through coolant channels to feed the coolant from the holder or the flange mount towards the two standard Bridge bars, and have a complementary locking screw of the standard Bridge bars.

Note! These new Jumbo Bridge bars 'S' can hold all classic Bridge bars (the new 'S', or the previous ones): when using the previous ones, the complementary clamping screw cannot be used. Through coolant to the cutting edge is only possible when using 'S' Jumbo Bridge bars and 'S' standard Bridge bars. In order to keep balance, do not mix new and previous standard Bridge Bars and blocks on the same Jumbo Bridge bar.

Features

6 Bridge bars for boring



Ø 204–655 mm *(Ø 8.032–25.787")* **also OD-overturning Ø 48–521 mm** *Ø 1.890–20.512")* **and back-boring.**

Bridge bars have a machine side connection Ø 130 mm *(Ø 5.118")* for direct fitting onto arbors for Bridge bars (SA and HSK) or onto the Graflex® adapter.

When using the Graflex® adapter, extensions are possible as well as spindle flange clamping, see Graflex® modular system. Angular position of the Bridge bar every 30° onto the arbors or Graflex® adapter, for optimized magazine storage.

Bridge bars can hold rough, fine, counterweight or Graflex® boring blocks. The boring blocks are locked onto the Bridge bar by means of two cylinders actuated by three clamping screws: One of the clamping screws has a stop disc, which limits the block's sliding stroke inside its setting capacity and stops the block from sliding out of the Bridge bar. Precise and step free block sliding for diameter adjustment 38 mm *(Ø 1.496")* stroke on radius, using the block's adjusting screw which is linked to the retaining pin of the Bridge bar.

Coolant through the Bridge bars and the boring blocks, towards the cutting edges.

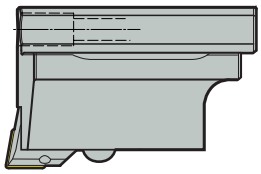
For the Bridge bar and Jumbo Bridge bar selection, related to the boring, OD-overturning or back-boring diameter to be produced, see Bridge bar selection charts, page(s) 665-670.

Max RPM, see page(s) 676.

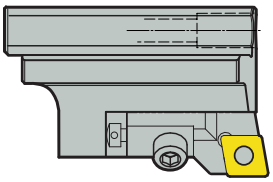
Note! These Bridge bars (Part No. A731S 0_0) cannot hold previous types of boring blocks (Part No. A731 _00 -without S-).

Features

Rough boring block



A large twin rough boring head requires two rough boring blocks, each equipped with a cartridge. Rough boring block through coolant, towards the cutting edge.



When using the Graflex® adapter, extensions are possible as well as spindle flange clamping, see Graflex® modular system.

Angular position of the Bridge bar every 30° onto the arbors or Graflex® adapter, for optimized magazine storage.

Bridge bars can hold rough, fine, counterweight or Graflex® boring blocks.

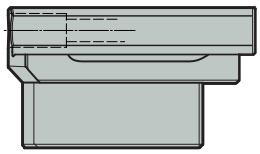
Cartridges

A large range of cartridges is available:

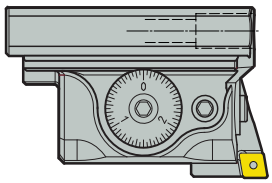
- Cartridges with 90° lead angle, recommended in most of the boring applications for a lower power consumption.
- Cartridges with 80° lead angle, recommended for through hole boring (and chamfering), particularly in cast iron to avoid exit failure. The power consumption is higher.
- Other cartridges with ISO5611/h1 = 16 mm *(0.629")* fitting interface are suitable.

NOTE! The two cartridges can be set on the same diameter (symmetrical boring) or in a staggered position (staggered boring). A cartridge raising corner shim is available as an accessory (Part No. 18LS0316). Assembling and setting procedures, see page(s) 665-670.

Fine boring block and counterweight block



A large fine boring head requires one fine boring block equipped with an insert holder and one counterweight block.



Diameter setting mechanism of the fine boring block with a micrometric setting screw (1 increment = 5 µm *(197 µin)* on the diameter).
The setting system is protected and lubricated for life.

The precision of the mechanism guarantees repeatable accuracy.
The diameter adjusting screw is located on the side of the block to offer easy access.

Fine boring block through coolant, towards the cutting edge.

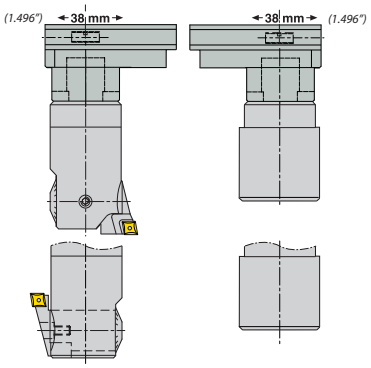
Suitable fine boring insert holders A72460, A72560 or A72660

Suitable fine boring insert holders A72460, A72560 or A72660 have to be ordered separately: they are the same as on radial type fine boring heads, see page(s) 654, 655.

Assembling and setting procedures, see page(s) 665-670.

Features

Graflex® boring blocks, for OD-overturning or back-boring



This block has a female Graflex® front connection size G5.

Any Graflex® boring head, special tool or standard Graflex® module size G5 can be mounted onto the Bridge bars, e.g. the drawing showing set-ups for OD-overturning or back-boring using two Graflex® boring blocks fitted with a Graflex® fine boring head A78050 with insert holder (e.g. A72550 for OD-turning) a OD-turning insert holder
(e.g. A789X30CC0690) and a Graflex® counterweight (e.g. Part No. BM050W78050).

Two positions of the Graflex® module are possible on the block, as it has 2x2 ball nose screw positions, and two tenon notches placed at 180°. Block and boring head through coolant, towards the cutting edge.

Assembling and setting procedures, see page(s) 665-670.

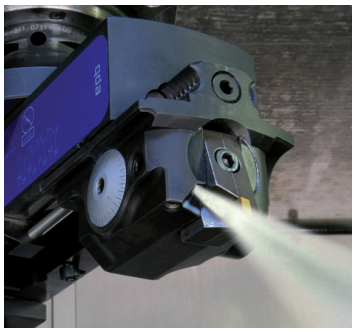
Graflex® boring blocks, for OD-overturning or back-boring

These boring blocks (Part No. A731S 400, A731S 500, A731S 600, A731S 40128) can also be fitted onto the previous type of Bridge bars (Part No. A731 0_0 -without S-).

Assembling and max. RPM instructions of the previous type of Bridge bars being valid.

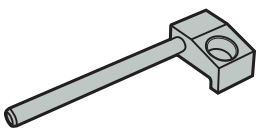
In order to keep balance, do not mix new and previous blocks on the same Bridge bar.

NOTE! These new boring blocks can also be fitted onto the previous type of Bridge bars



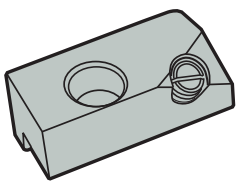
Advice for 'through coolant' accessories selection

Roughing (Bridge bar with 2 rough boring blocks):



For directable coolant supply onto both cutting edges, use 2 coolant pipe connectors (Part No. AU731S00700), to be mounted onto the Bridge Bar, and 2 directable coolant supply nozzle sets (Part No. AU731S40700), to be mounted onto each rough boring block. For normal through coolant from the block's channel, use 2 coolant pipe connectors (Part No. AU731S00700), to be mounted onto the Bridge Bar.

Fine boring (Bridge bar with 1 fine boring block & 1 counterweight):



Use 1 coolant pipe connector (Part No. AU731S00700), to be mounted onto the Bridge Bar in order to connect the fine boring block. As the fine boring block originally features a coolant supply nozzles, directable coolant supply is directly obtained.
OD-overturning (e.g. Bridge bar with 2 Graflex® boring blocks equipped with one fine boring head and one counterweight): Use 1 coolant pipe connector (Part No. AU731S00700), to be mounted onto the Bridge bar in order to connect the Graflex® boring block with fitted boring head. Graflex® boring block's central coolant channel will feed coolant into the fitted boring head

Coolant pipe connector
(Part No. AU731S00700)

Directive coolant supply nozzle set
(Part No. AU731S40700)

NOTE! Allowable coolant pressure = 70 bars maximum.

Building Bridge bar boring assemblies

A rough boring assembly up to Ø 655 mm requires *(Ø 25.787")*: 1 Bridge bar (A731S 0_0) + 2 rough boring blocks (2x A731S 400) with 2 cartridges*.

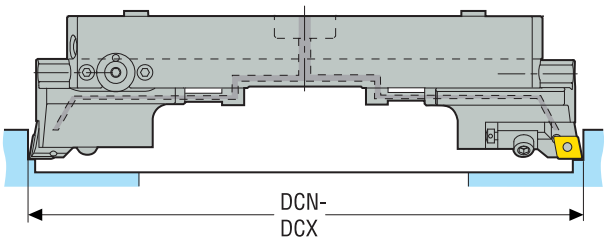


Fig. 1

A fine boring assembly up to Ø 655 mm requires *(Ø 25.787")*: 1 Bridge bar (A731S 0_0) + 1 fine boring block (A731S 500) with 1 fine boring insert holder size 60 + 1 counterweight block (A731S 600).**

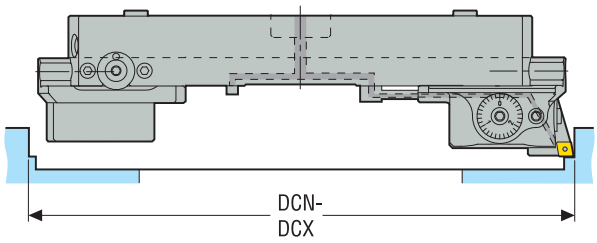

Fig. 2

A rough boring assembly up to Ø 3205 mm *(Ø 126.181")* requires: 1 Jumbo Bridge bar (A731S 00_) + 2 Bridge bars (A731S 0_0) + 2 rough boring blocks (2x A731S 400) with 2 cartridges*.

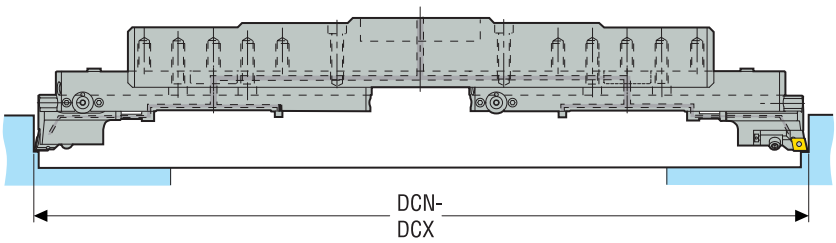

Fig. 3

A fine boring assembly up to Ø 3205 mm *(Ø 126.181")* requires: 1 Jumbo Bridge bar (A731S 00_) + 2 Bridge bars (A731S 0_0) + 1 fine boring block (A731S 500) with 1 fine boring insert holder size 60 + 1 counterweight block (A731S 600).**

Building Bridge bar back-boring assemblies:

A fine back-boring assembly up to Ø 676 mm *(Ø 26.614")* requires: 1 Bridge bar (A731S 0_0) + 2 Graflex® blocks (2x A731S 40128) + e.g. 1 fine boring head (A780 50) with 1 back boring insert holder size 50* + 1 counterweight (BM050W78050).

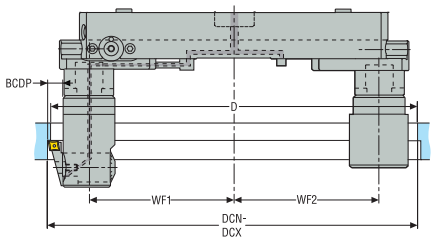

Fig. 1

A fine back-boring assembly up to Ø 3226 mm (Ø 127.008 “) requires: 1 Jumbo Bridge bar (A731S 00_) + 2 Bridge bars (A731S 0_0) + e.g. 1 fine boring head (A780 50) with 1 back boring insert holder size 50* + 1 counterweight (BM050W78050).

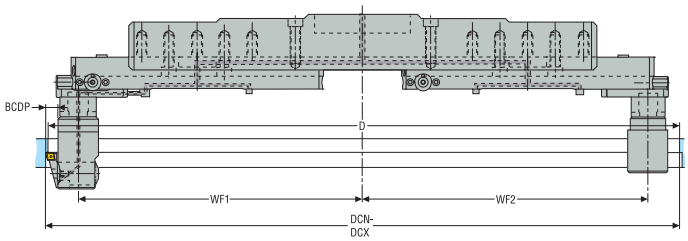

Fig. 2

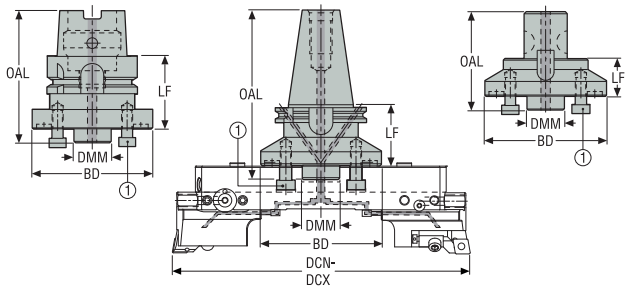
* Insert holders to be ordered separately.

Determination of minimum access diameter (D min)

Balancing condition: WF1 = WF2

D min = DC + 5- BCDP

BCDP = distance between insert’s cutting edge and fitted boring head’s A78050 body (7,5 < BCDP < 18,5).



The two extreme cases:

Boring head A78050 set to capacity mini:	D min = DCN - 2,5
Boring head A78050 set to capacity maxi:	D min = DCX -13,5

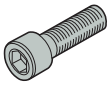
ABB 731 200 – Holders and adapter for Bridge bars

1. Adjusting screw



- HSK and SA holders for short assemblies
- Graflex® adapter for extended assemblies
- Angular position of the Bridge bar every 30°
- Delivered with a spigot sealing o'ring ∅ 58×3 mm

Spare parts for cartridges; see catalog Turning

Recommended machining conditions

Best performances are obtained with through coolant (higher machining data, better surface finish, better chip evacuation).

Rough boring depends on the priorities: higher feed or larger chip removal use symmetrical setting of the cartridges (most common method, double feed compared to staggered setting), or staggered setting (double depth of cut).
In fine boring in steel, with good conditions, we recommend to use Cermet inserts, for high speeds and long life.

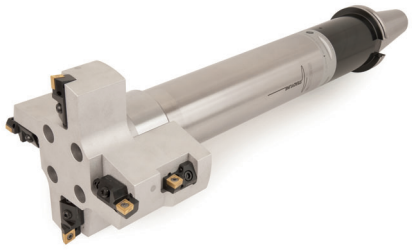
For detailed user instructions, please refer to the operating instructions supplied as part of the delivery content of the boring heads and with the Steadyline® bars. These operating instructions can also be downloaded from www.secotools.com.

Troubleshooting

Please refer to troubleshooting advice, in rough boring chapter page 598, or fine boring chapter page 643.

Maximum speeds for Bridge bars

Due to the large sizes of Bridge bar boring heads, unsuitable RPM programming could cause unpredictable damage.
Below max. RPM are for present Bridge bar boring assemblies using present Bridge bar types (Part No. A731S 0_0) rough boring, fine boring and counterweight boring blocks (Part No. A731S _00) and Jumbo Bridge bar (Part No. A731 00_). For other assemblies, please contact your local Seco representative.



NOTE! when using present boring blocks (Part No. A731S 400, A731S 500, A731S 600, A731S 40128) onto previous type Bridge bars (Part No.A731 0_0 -without S-), the max RPM to consider are the ones recommended for the previous type Bridge Bars. To maintain balance,do not mix new and previous blocks on the same Bridge bar.

Head based on	Capacity ∅ mm *(inch)*	Max. RPM	Implied max cutting speed v_c at min. Cap. m/min *(sf/min)*	Implied max cutting speed v_c at max. Cap. m/min *(sf/min)*
Bridge bar boring heads (with two boring blocks set symmetrically)

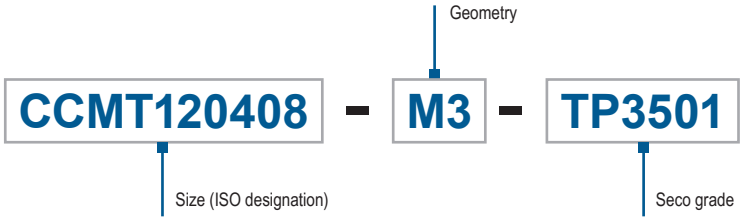
A731S020	279-355 *(10.9843-13.9764")*	1150	1007 *(3304)*	1282 *(4206)*
A731S030	354-430 *(13.937-16.9291")*	900	1000 *(3281)*	1215 *(3986)*
A731S040	429-505 *(16.8898-19.8819")*	750	1010 *(3314)*	1189 *(3901)*
A731S050	504-580 *(19.8425-22.8346")*	650	1029 *(3376)*	1184 *(3885)*
A731S060	579-655 *(22.7953-25.7874")*	550	1000 *(3281)*	1131 *(3711)*
Jumbo Bridge bars (with two identical Bridge bars and boring blocks set symmetrically)				
A731S001	654-1105 *(25.748-43.50394")*	170	349 *(1145)*	590 *(1936)*
A731S002	1104-1630 *(43.46457-64.17323")*	100	346 *(1135)*	512 *(1680)*
A731S003	1629-2155 *(64.13386-84.84252")*	70	358 *(1175)*	473 *(1552)*
A731S004	2154-2680 *(84.80315-105.5118")*	50	358 *(1175)*	420 *(1378)*
A731S005	2679-3205 *(105.4724-126.1811")*	40	336 *(1102)*	402 *(1319)*

Note: The maximum speeds are related to the boring head's mechanical design and balancing quality. Speeds inside these limits have to be chosen in regard to the other machining conditions, e.g. workpiece material, cutting edge (insert), tooling length, machine spindle.

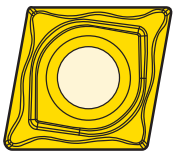
Custom made boring solutions

Seco Tools Tooling Systems has a strong experience in the design of custom made solutions for boring operations:

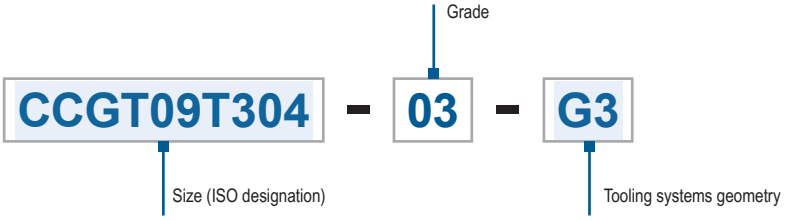
- Steadyline® vibration damping rough and fine boring solutions,
- Multi-edge boring bars,
- Special extensions with guiding pads, for long overhang operations,
- Combined bars for drilling, boring, chamfering, reaming, threading operations...



Please contact your local Seco representatives for more information.

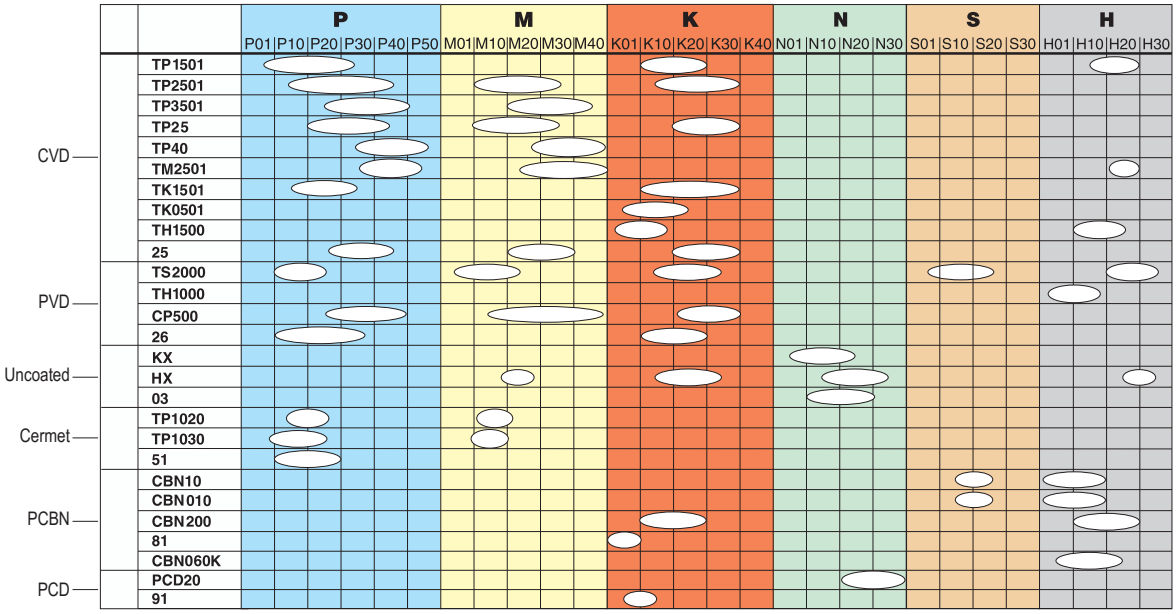


A selection of inserts for boring

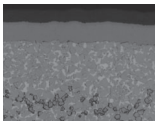


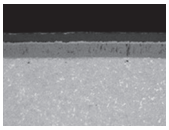
This is a selection of inserts from the total Seco range, which are particularly suitable for boring. The selected insert sizes are those suitable for the range of boring heads.
Inserts for rough boring have high toughness to guarantee high metal removal and positive geometries to minimise spindle torque requirement.

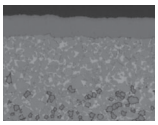
Inserts for fine boring have positive geometries and sharp edge wear resistant grades for accurate control of the bore tolerance, geometry and surface finish.

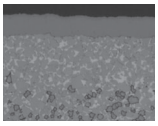


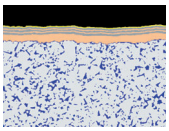
Code keys, examples

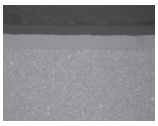


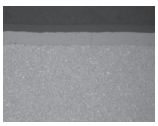


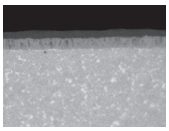


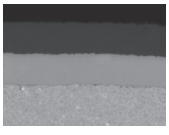


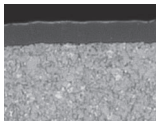


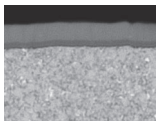




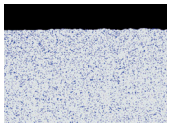






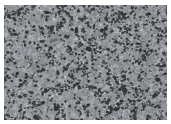


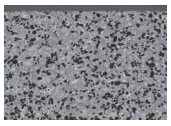
Insert grades for boring – ISO workpiece material classification

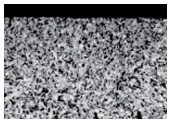


CVD coated grades recommended for boring

TP1501		**Duratomic®** technology coated grade. Highly heat and wear resistant grade extremely well suited for productive general turning of steels and a useful backup in other material groups. Ti(C,N) + Al_2O_3 + ...
TP25		Universal grade for high versatile performance over a wide range of applications in steels, stainless steels and cast irons. Trustworthy alternative at limited cutting speeds or high surface finish requirements. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP2501		**Duratomic®** technology coated grade. Designed with high wear resistance and edge strength applicable in a wide range of turning applications in steels as well as many stainless steels and cast irons. Ti(C,N) + Al_2O_3 + ...
TP3501		TP3501 is intended for boring operations where the primary demand is toughness and reliability in machining steels and stainless steels. Ti(C,N) + Al_2O_3 DURATOMIC®
TP40		TP40 is the basic grade for turning in the P40 range. Very tough grade for demanding operations on steel castings and forging, and on all types of stainless steel. TiC/Ti(C,N) + TiN
TK0501		**Duratomic®** technology coated grade. A extremely wear resistant optimized grade choice for machining of grey cast iron and easier ductile cast irons. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TK1501		**Duratomic®** technology coated grade. A highly wear resistant grade for cast irons in general as well as in steels. The grade is particularly capable in machining of ductile (nodular) cast irons also in more demanding setups and interrupted cuts. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TM2501		Duratomic® grade. A highly capable grade for austenitic stainless steel turning with combinations of high resistance and superior edge toughness. First choice in austenitic stainless steel turning. Complements in steel turning with heavy intermittent cuts. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TH1500		DURATOMIC® technology coated grade. An extremetly hard super micrograin grade intended for machining of partly hardened steels and provide an alternative for cast iron finishing. Ti(C,N) + Al_2O_3
25		Universal grade. The grade is intended for a wide range of boring applications in steel, stainless steel and cast iron. Good combination of wear resistance and toughness. Ti (C, N) + Al2O3.

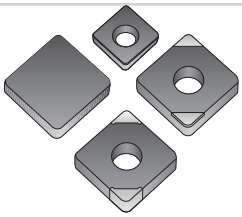


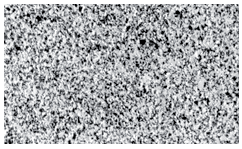


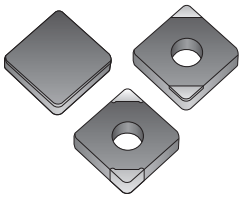


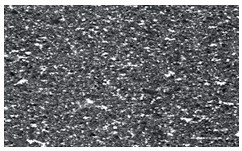
PVD coated grades recommended for boring

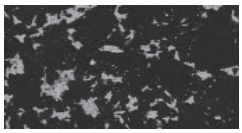
TS2000		Hard micrograin principally intended for finishing operations in superalloys and titanium alloys. Also performs well in finishing operations on stainless steel. (Ti,Al)N + TiN
CP500 & 26G6		A very tough micrograin intended for finishing and medium roughing of stainless steel. Can handle intermittent cutting operations very well. CP500 is also an alternative for aluminium alloys. (Ti,Al)N + TiN
TH1000		Very hard supermicrograin grade intended for partly hardened steel components as well as generally workpiece materials such as superalloys and due to remarkable edge toughness it also provides high performance in interupted cuts and hard-surface removal.











Uncoated grades recommended for boring

KX & 03G3		Micrograin intended for machining aluminum and other non-ferrous materials.
HX		Universal uncoated grade intended for machining of cast iron and hardened steels useful also in non-ferrous materials.

Cermet recommended for boring

TP1020		Cermet with very high wear resistance intended for highest surface finish requirements with predictability and control in steel and stainless steel.
TP1030		PVD-coated Cermet with very high wear resistance intended for high surface finish and productivity requirements with predictability in steel and stainless steel mainly. Ti-Al-Si-N nanolaminate coating.
51G1		Cermet with very high wear resistance. Intended for finishing operations on steels, in which strict demands are made on surface finish.

CBN and PCD grades recommended for boring

CBN010		Format: Solid, full-face brazed layer and brazed tips (single and double sided). Composition: 50% CBN content grade with an average grain size of 2 µm and a TiC ceramic binder. Coating: No coating.
CBN10 & 81B1		CBN, Cubic boron nitride grade, for light continuous to moderate interrupted cuts. Intended for fine boring in hardened steel and in superalloys.
CBN060K		Format: Solid & brazed tips (single & double sided). Composition: 60% cBN content grade with an average grain size of 1-2 µm and a TiCN ceramic binder. Coating: (Ti, Al, Si)N coating.
CBN200		Format: Full-face layer and brazed tips (single sided). Composition: 85% cBN content grade with an average grain size of 2 µm and a Co-W-Al ceramic binder. Coating: No coating.
PCD20 & 91J3		PCD, polycrystalline diamond, for boring in aluminium and Al-alloys, copper, brass, bronze and synthetic materials.

Inserts, recommended for rough boring, with cutting data

Suitable holders for boring heads

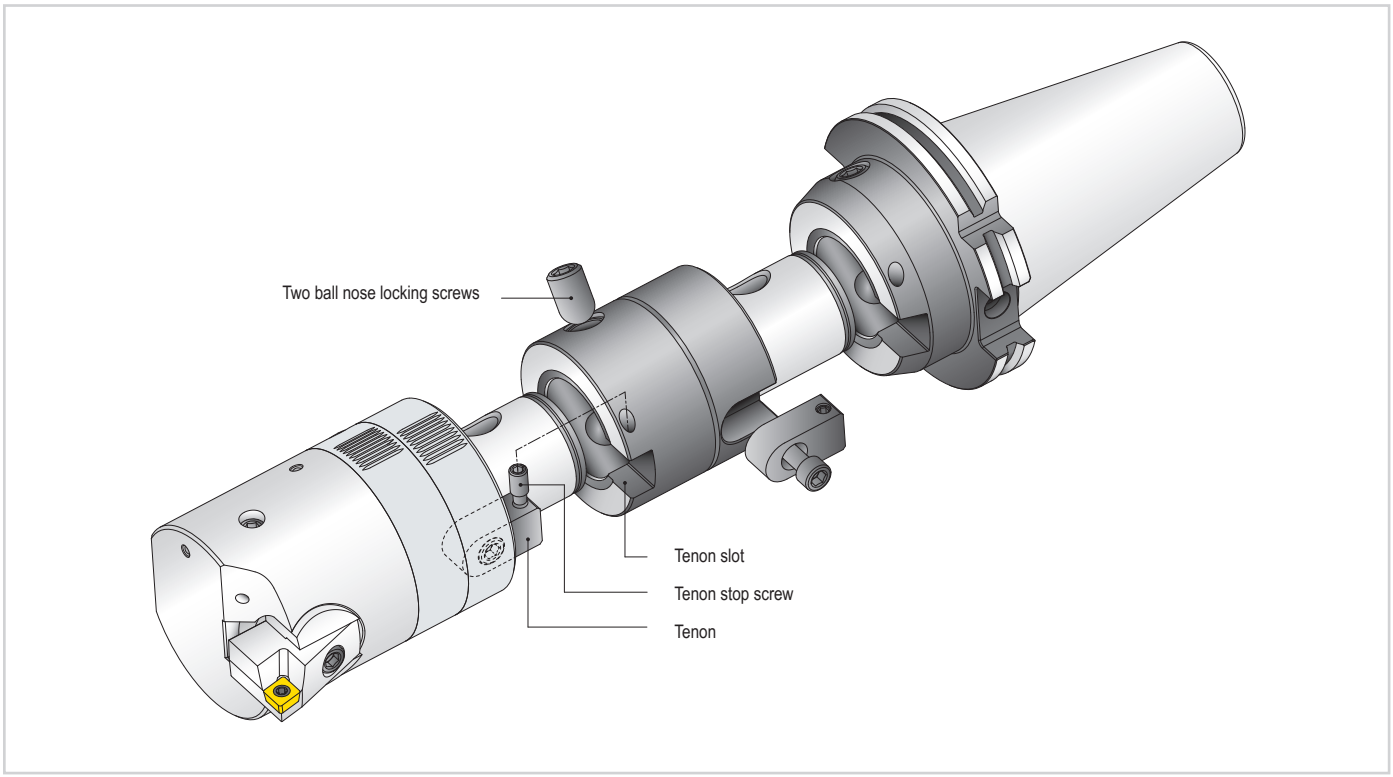
The boring heads feature Graflex®, Seco-Capto™, GL or BA machine side connection

The boring heads can be used on any machine type, using the suitable Graflex® adapter, Seco-Capto™ adapter or Steadyline® vibration boring/turning bar.

Steadyline® vibration damping for boring operations
Boring heads with GL or BA machine side connections are designed to be mounted on Steadyline® boring/turning bars with HSK-T/A and Seco-Capto™ machine side connections. This allows to perform rough and fine boring operations with 6xD, 8xD and 10xD projections, in very stable conditions.

Modular Graflex® and Seco-Capto™ boring bars
All bore lengths up to 6xD can be reached by selecting the required Graflex® intermediates, e.g. the extra-long ones with extension section in carbide. Highest assembly rigidity is obtained by selecting the longest and widest arbor possible, then completing with smaller intermediates.

The Graflex® and Seco-Capto™ connections guarantees a unique orientation of the boring heads, achieving a cutting edge orientation according to ISO. The Graflex® modules are designed to be clamped together by the side.



For boring heads with GL machine side connection for Steadyline®, select the shortest Steadyline® bar from the Tooling Systems catalog. These bar exist with HSK-T/A and Seco-Capto™ machine side connection. Other spindle types can be equipped, using the shortest Seco-Capto™ adapters.
For classic boring heads (steel), select the classic Graflex® and Seco-Capto™ arbors and intermediates from the Tooling Systems catalog.
For Bridge bars, see Graflex® adapters and direct holders page 671.

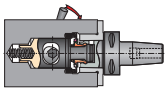
Note! Jumbo Bridge bars are designed to be held on milling cutter holders or to be fitted directly on a machine's spindle front.

Locking advice for Graflex® classic connection shanks G. on boring heads (using a tenon with stop screw).

For boring, no need to tighten the tenon's stop screw, as the connection's self locking action is allowed.
For rough boring in heavy duty, we recommend to apply the 'high value' torques for the Graflex® ball nose screws.

See also the detailed 'Graflex® connection assembly procedure' in the Tooling Systems catalog.

Locking advice for Seco-Capto™ connection shanks C. on boring heads: No specific advice. For boring heads, the general instructions are applicable, see below.

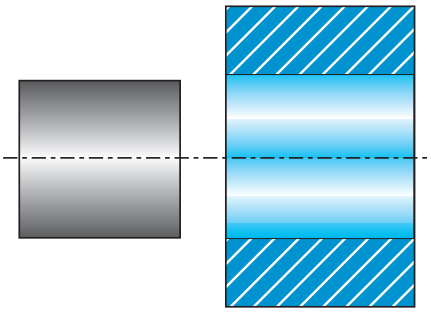


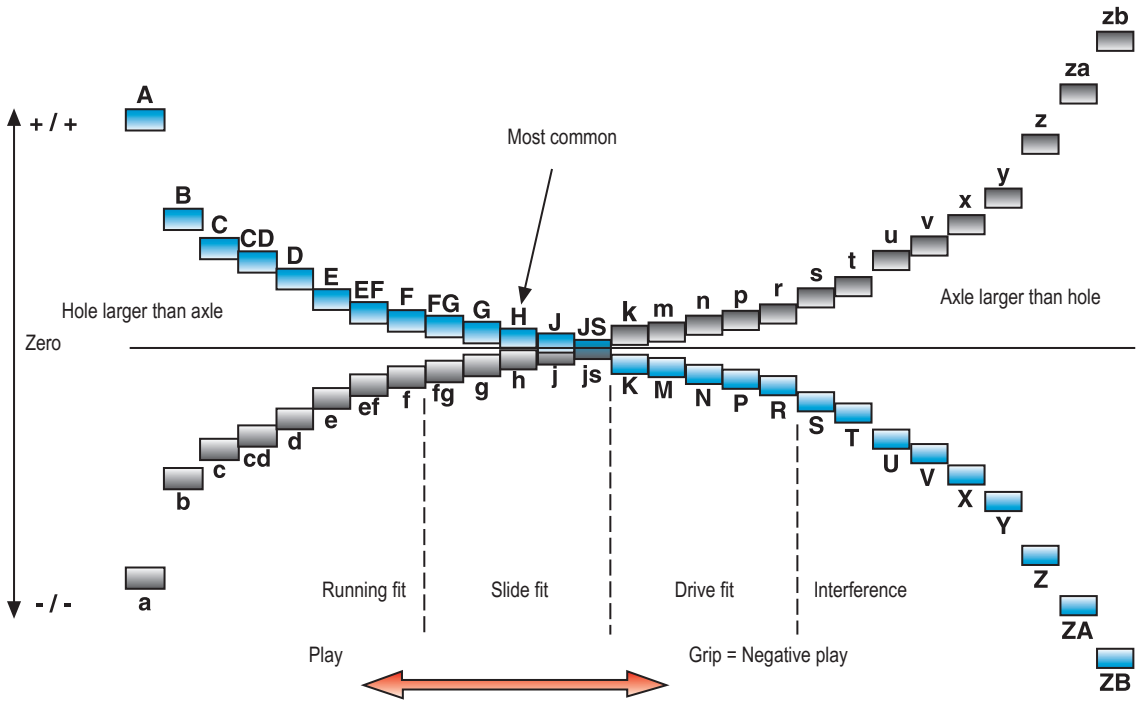
Tightening torques for Seco-Capto™ receivers connections with center bolt clamping (Basic Holders, Intermediates).

Seco-Capto Size	Centre bolt tightening torque (Nm)	Centre bolt tightening torque (ft/lbs)
C3	40-50	30-37
C4	50-60	37-44
C5	90-100	66-74
C6	160-180	118-133
C8	160-180	118-133

Tightening torques for Seco-Capto™ receivers connections with segment clamping, actuated by cam shaft side locking (Flange Mounts.)

Seco-Capto Size	Cam tightening torque (Nm)	Cam tightening torque (ft/lbs)
C3	35	26
C4	50	37
C5	70	52
C6	90	66
C8	130	96





The Seco-Capto™ joint features a self-locking taper. Where the center bolt system is used, unscrew the centre bolt until the bolt head makes contact with the tool holder, causing the bolt to force the taper joint apart. When using the cam shaft side clamping system, over untightening of the cam will force the taper joint apart.

ISO Standard tolerance for hole and shaft – Axle tolerances

Axle tolerance position is denominated with **small letters**

Bore tolerance position is denominated with **CAPITAL LETTERS**

Cemented carbide inserts and insert carriers

Cemented carbide inserts and cemented carbide insert carriers from Seco Tools are not included in the product range intended for the following requirements.
Nevertheless Seco Tools can make the following declaration.
These products meet all requirements in RoHS (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment), WEEE (Waste Electrical & Electronic Equipment) and ELV (End of Life Vehicles) requirements.
Products do not contain mercury, lead, hexavalent chromium, cadmium, CFC, HCFC, flame retardants or solvents in concentrations that exceed specifications in the regulations.

Regrinding:
Wet or dry grinding can produce potentially hazardous dusts or mists that can irritate skin, eyes, nose, throat and result in lung damage or disease. To avoid injury use proper safety precautions and protective equipment.

Disposal:
Seco Tools will buy back used inserts and solid carbide tools for recycling. Inserts and solid carbide tools should be separated from other metal waste (steel, aluminium, copper etc).
All packing material is fully recyclable.

CBN and PCD inserts

Inserts from Seco Tools are not included in the product range intended for the following requirements. Nevertheless Seco Tools can make the following declaration.
This product meets all requirements in RoHS (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment), WEEE (Waste Electrical & Electronic Equipment) and ELV (End of Life Vehicles) requirements.
Products do not contain mercury, lead, hexavalent chromium, cadmium, CFC, HCFC, flame retardants or solvents in concentrations that exceed specifications in the regulations.

Regrinding:
Wet or dry grinding can produce potentially hazardous dusts or mists that can irritate skin, eyes, nose, throat and result in lung damage or disease. To avoid injury use proper safety precautions and protective equipment.

Disposal:
Seco Tools will buy back used CBN- or PCD-tipped inserts for recycling. Inserts should be separated from other metal waste (steel, aluminium, copper etc). Solid CBN-inserts may be discarded as landfill waste.
All packing material is fully recyclable.

Black oxide insert carriers

Insert carriers from Seco Tools are not included in the product range intended for the following requirements. Nevertheless Seco Tools can make the following declaration.
This product meets all requirements in RoHS (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment), WEEE (Waste Electrical & Electronic Equipment) and ELV (End of Life Vehicles) requirements.
Products do not contain mercury, lead, hexavalent chromium, cadmium, CFC, HCFC, flame retardants or solvents in concentrations that exceed specifications in the regulations.

Disposal:
Used insert carriers may be sent for recycling together with ordinary steel waste (swarf and discarded steel scrap) for recycling.
All packing material is fully recyclable.

Cermet inserts

Inserts from Seco Tools are not included in the product range intended for the following requirements. Nevertheless Seco Tools can make the following declaration.
This product meets all requirements in RoHS (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment), WEEE (Waste Electrical & Electronic Equipment) and ELV (End of Life Vehicles) requirements.
Cermet grade C15M inserts do contain nickel and will leach nickel when in contact with the skin. Amount of leaching is higher than specified in norm SS-EN 1811 Reference test method for release of nickel from products intended to come into direct and prolonged contact with the skin. These norms are intended for products that are in direct and prolonged contact with the skin and are therefore not directly applicable for cermet inserts. Persons with known allergic reactions to nickel are advised to wear protective gloves when handling cermet inserts.

Regrinding:
Wet or dry grinding can produce potentially hazardous dusts or mists that can irritate skin, eyes, nose, throat and result in lung damage or disease. To avoid injury use proper safety precautions and protective equipment.

Disposal:
Used inserts may be recycled. Inserts should be separated from other metal waste (steel, aluminium, copper, etc) including cemented carbide inserts.
All packing material is fully recyclable.

Nickel coated insert carriers

Insert carriers from Seco Tools are not included in the product range intended for the following requirements. Nevertheless Seco Tools can make the following declaration.
This product meets all requirements in RoHS (Restriction of the use of certain Hazardous Substances in electrical and electronic equipment), WEEE (Waste Electrical & Electronic Equipment) and ELV (End of Life Vehicles) requirements.
Products do not contain mercury, lead, hexavalent chromium, cadmium, CFC, HCFC, flame retardants or solvents in concentrations that exceed specifications in the regulations.
Insert carriers do contain nickel and will leach nickel when in contact with the skin. Amount of leaching is not higher then norm SS-EN 1811 Reference test method for release of nickel from products intended to come into direct and prolonged contact with the skin.
These norms are intended for products that are in direct and prolonged contact with the skin and are therefore not directly applicable for insert carriers.
Persons with known allergic reactions to nickel are advised to wear protective gloves when handling nickel coated insert carriers.

Disposal:
Used tools maybe sent for recycling together with ordinary steel waste (swarf and discarded steel scrap) for recycling.
All packing material is fully recyclable.

Turning

Seco

At Seco, we make tools, tech, and solutions for the most advanced manufacturing challenges on Earth. From our founding in Fagersta Sweden, to today's global company, our business has always been made to measure, and built on trust.

Combining cutting-edge, precision tools with lasting, personal partnerships, we're a true people company helping our partners discover the future of the manufacturing industry.

We're proud to make for makers, invent for inventors, and partner with pioneers. Driving the future forward with our focus on innovation. In short - if the right tool for the job exists, we'll deliver it. If it doesn't, we'll create it.

We're proud to put sustainability at the heart of everything we do, challenging perceptions of our industry, changing the process of manufacturing, and playing our own small part in shaping a brighter looking future.

Made for Makers

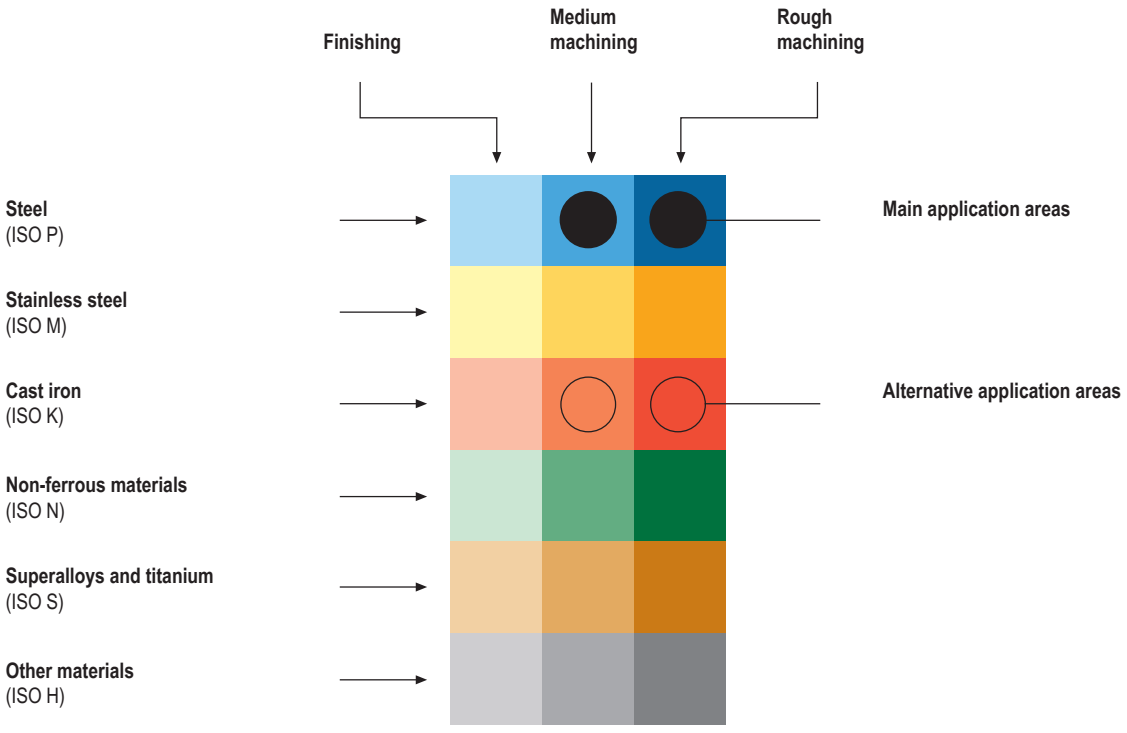
Introduction to choose product

To choose turning products can be quite a comprehensive task if every single detail should be taken into account. Since we have chosen turning the sought shape is basically well-turned or using the technical term a rotational symmetric component.

The present section will focus on coated cemented carbide applications and there is a separate section for advanced materials applications such as PCBN, PCD and Ceramics, but there are of course topics general for turning.

First steps – the Secolor® principle

Seco has a long tradition to work in accordance with the principle attributed to Albert Einsten in the 1950´s: "Everything should be made as simple as possible, but not simpler". However, it should always be easy to be successful, but the more detailed the requirements, the more details need to be considered.



The intention of this "Choose Product" section is to show how easy the choice of a product can be and the starting point is how Seco always intends to make turning easy. However, depending on your insight and your actual conditions it is recommended you jump in the process to fit your specific needs.

One first point is considering the purpose of the turning operation, and that most often starts with considering the turning insert, which can be studied in a lot of detail, or as simple as possible to ensure a successful outcome.

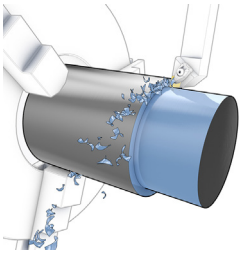
Secolor® is a simple system used to present recommended application areas of a specific turning insert. It is based on a matrix with eighteen squares symbolizing workpiece materials under different states of machining, indicating the main application areas by black dots and alternative application areas as circles. It should also only be understood as a starting point as most skilled professional in machining in general and turning in particular do.

In the example below, the product is recommended for medium and rough turning of steel workpieces as it's main application area, and in machining of cast iron components as an alternative solution.

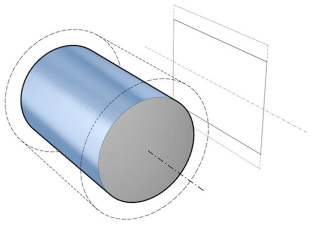
The objective is to eliminate waste, and this will become clearer as we go forward.

First steps – the insert shape & size

To choose turning products, one also needs to consider the purpose of the turning operation with its conditions, requirements and the degrees of freedom.



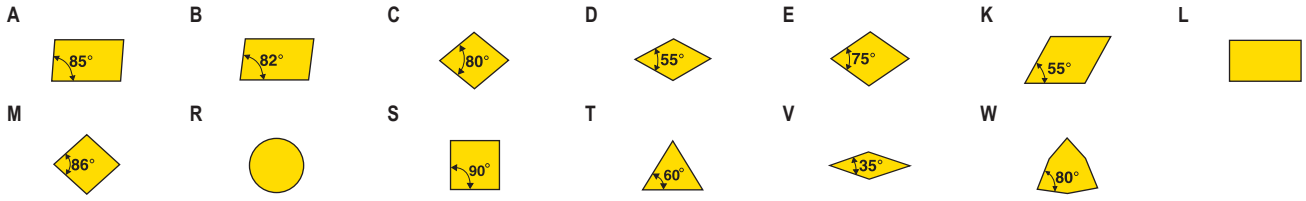
Now, the key points are



– How much stock is to be taken away?

– What does the pre-machined component look like?

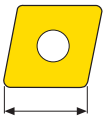
– What does the drawing specify about the finished component?

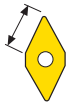


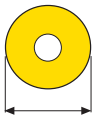
– And, last but not the least – What else needs to be taken into account?

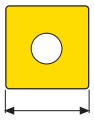
Standards created in the 70's define the insert by using the first letter of its shape as the first letter of the nomenclature, see the first letter of the code key below. Note that not all shapes are commonly used for machining applications such as turning.

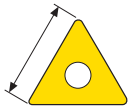
2. Insert shape











When choosing a common shape, for example a "C" shape with the 80° corner, the stock on a component (see the illustrations above) possible to remove is then depending on the size of the insert and its maximum depth of cut according to the table below.

Insert shape	Insert size	Maximum depth of cut a_p (mm)
		2 4 6 8 10 12 14 16 18 20 22 24 26 28
C	04	
	06	
	09	
	12	
	16	
	19	
	25	

In the above table the size of the inserts is indicated. If for example the stock is 4 mm and the idea is to cut it away in one (1) pass, it is recommended to use a "12" size "C" insert or bigger. On the next page a more complete set of relevant turning inserts are shown with their respective recommended ranges for depths of cut.

Insert shape and size

The application often determines what insert shape and size should be utilized

Insert shape		Insert size	Maximum depth of cut a_p (mm)
			2 4 6 8 10 12 14 16 18 20 22 24 26 28

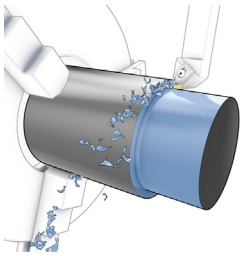
First steps – from insert to toolholder

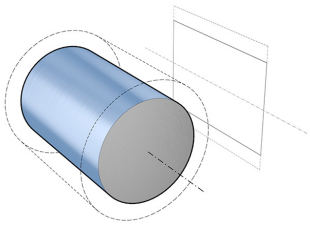
It is obvious from the earlier table that for the same stock removal, there are several insert options based on their shapes and sizes.

Just briefly, look at the insert sketches below.

An "R" shape insert has no corner however has big strong radius, an "S" shape insert has strong and equal corners, a "C" shape insert has a corner that can make 90° shoulders, and a "V" shape insert has a weaker corner but deep reach for deep profiles.



Now, the key points are



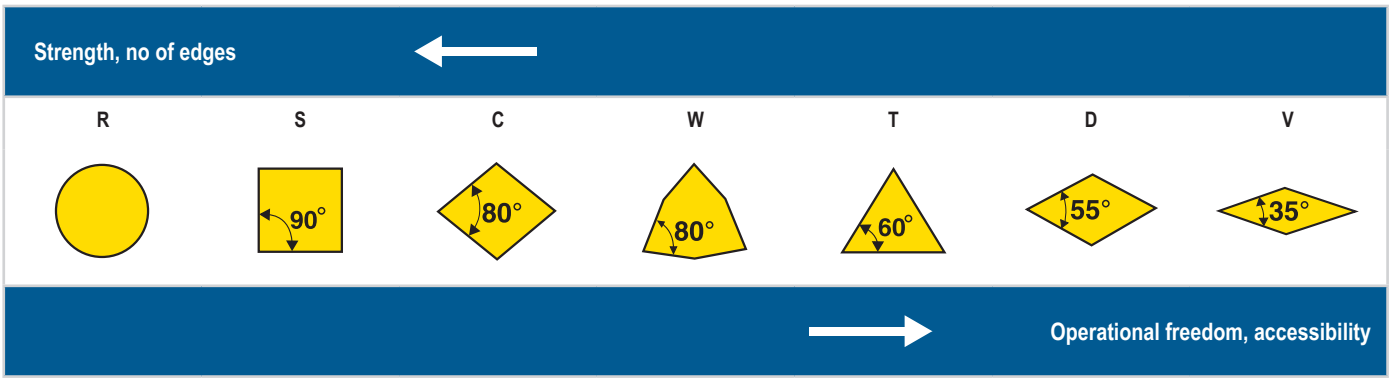
– How much stock is to be taken away?

– What does the pre-machined component look like?

– What does the drawing specify about the finished component?

– And, last but not the least – What else needs to be considered?

Look at the application sketches below, considering the two questions where to start and where to end. A rough first conclusion starting from below,

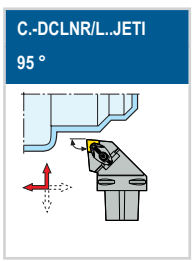


the"R" shape insert is perfect for slope profiles,

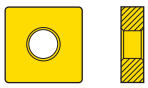
the"S" shape insert is perfect for straight feature surfaces,

the"C" shape insert is perfect for varying feature surfaces and

the"V"shape insert has a weaker corner but deep reach for deep features & profiles

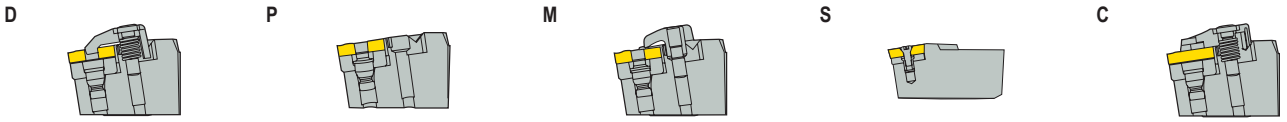


The chart below explains the different insert shapes with their relative strength, number of edges, operational freedom, and accessibility.



A second conclusion indicates the toolholder's importance to achieve the needed final part. The toolholder enables an insert to achieve a specific surface or profile. After focusing on the aspects of the toolholder there will be a comprehensive list of application toolholder guidance.

Inserts CN..



Inserts SN..

First steps – the toolholder

1. Insert clamping

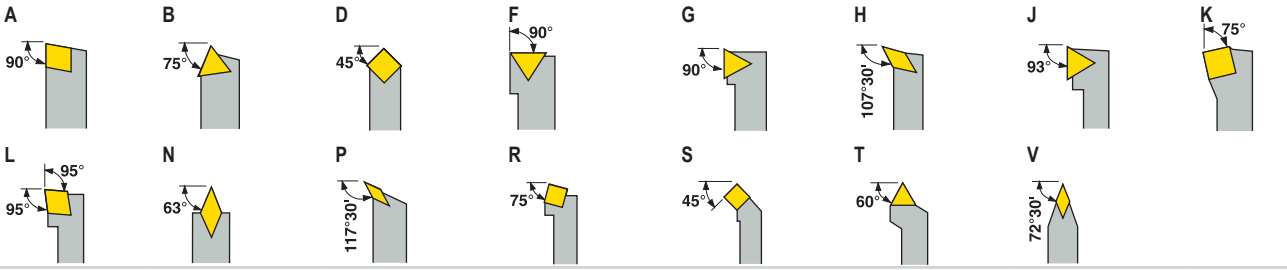
In the pictures above a range of common toolholder solutions for insert clamping where Seco has chosen to mainly offer ”C”, ”D” and ”S”, but there are a number of options. On this page there will however be brief suggestions how to handle options with brief ”pros” and ”cons” on each, but it will be fully covered later in the Product Detail Guidance sections in the catalogue.

These letters denote the clamping style on a toolholder, and should not be mixed up with the earlier mentioned letters for the insert nomenclature.

Seco clamping designs can be summarized (see page 84 for more details on clamping) as follows

”C” clamping
– extremely rigid top clamp with pressure plate suited especially for advanced material inserts but also a number of cemented carbide inserts.

”D” clamping
– stable and rigid top clamp also re-appearing in the form of the Jetstream Tooling® JETI coolant clamp for for most applications with double sided inserts with a through hole.



”M” clamping
– classic double security clamping with eccentric pin locking in hole, and complimented by a top clamp, still common in some areas for double sided inserts.

”P” clamping
– a group of several clamping designs avoiding interference in the chip space above double sided inserts with hole in different ways. It consists of, for example, toggle lever-clamping, wedge-clamping and excenter-pin clamping.

”S” clamping
– the most straight forward proven solution for screw-hole, often single sided inserts without interference in the chip space above the insert where the screw needs to be removed to exchange the insert.

First steps – code for toolholder application

3. Tool type

Now as seen earlier there are several demands and requirements on the generation of surfaces in turning. The above sketches on the codes for tool types give hint on the options connected to the position ”3” in the below code key for toolholders.

D	W	L	N	R	25	25	X	06	JETI
1	2	3	4	5	6	7	8	9	10

The options so far actually connect to the code keys of toolholders where

”Position 1” corresponds to the ”Clamping design”

”Position 2” corresponds to the ”Insert shape”

”Position 3” corresponds to the ”Tool type”

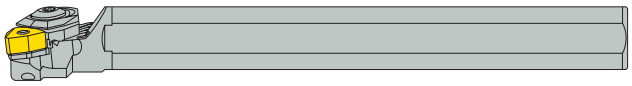
Please go back to the earlier comprehensive Code Key pages for detailed descriptions.

First steps – toolholder to machine

There are several connections to a standardized machine connection and this will be covered briefly here to connect to the code keys.

Please refer back to the earlier comprehensive Code Keys pages for detailed descriptions.

The most common classic toolholder connection for external application is a square connection and most often fixed with a set of screws. In the code key to the right that connection size is indicated with ”2525” in ”position 6” and” position 7”. In position 8, the length code “X” indiactes a non-standard length, and this will be found in the product pages.

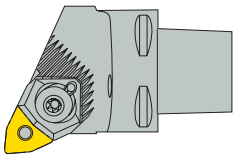


Note ANSI shank code relates to how many 16th of an inch, further detailed in the ANSI [inch] Code Key.

D	W	L	N	R	25	25	X	06	JETI
1	2	3	4	5	6	7	8	9	10

Going to internal applications the toolholder connections are similar and fixed with screws but in the standard the connection size is indicated in ”position 2” where ”20” in the example to the right means 20 mm. The length is represented in “position 3” in the letter “Q” corresponding to 180 mm (see the Code Key).

Note that a ANSI shank code A20-... corresponds to the number of 16th of an inch i.e. significantly bigger shank than the metric version. 20 on an ANSI description would represent 1.250” i.e. just about 32 mm in diameter..



A	20	Q	-	P	W	L	N	R	06	R
1	2	3		4	5	6	7	8	9	10

However more modern machine connection standards such as Seco-Capto™ to the right, Seco-Capto™ uses the logic to start with the connections size i.e. the connection size ”C4” in ”position 1” in the code key to the right. The functional width and length are found in that order in “position 7” and “position 8” always measured in mm.

There are a number of interesting modular solutions available such as the GL-connection especially for stabilized internal applications and QC-connection for external applications in small part machining, but those are connected to machines with a back-end according to above e.g. Seco-Capto™ or square shank.

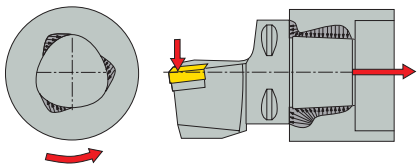
Please go back to the earlier comprehensive Code Keys pages 11-22 for detailed descriptions.

C4	-	P	W	L	N	R	-	27	050	-	06	-	
1		2	3	4	5	6		7	8		9		10

Seco-Capto™ – brief description

This, now standardized system, as per ISO26623 is a modular system for machines such as lathes introduced from the 1990´s for fast and efficient change of holders and inserts summarized as “quick-change”.

The main benefits are

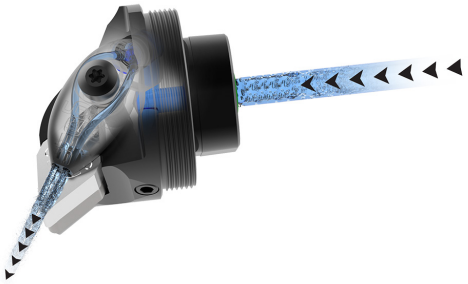


– Increased total productivity from the faster tools changes

– High precision, rigid, self-centering connection due to the strong conical polygon giving repeatability within microns

– Increased productivity since no need for cutting data adjustments due to the stable connection

– Reduced inventory of holders in a workshop due to same precise standardized machine side connection



– Through-coolant means no separate coolant handling, which goes extremely well with Seco Jetstream Tooling solutions

Seco Jetstream Tooling® – brief introduction

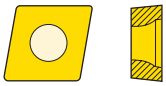
This revolutionary innovation delivers high pressure coolant jet precisely to cutting zone – available in all Seco turning product areas.

The General ISO Turning Jetstream Tooling® toolholder to the right indicates yet another revolution using the leading JETI-coolant clamp designs.

The main benefits with Seco Jetstream Tooling® are

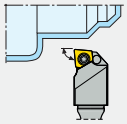
– Tool life improvement due to the high-pressure jet lifting chips away from the rake face

– Improved chip control in many applications especially when finishing



– Increased tool life due to the precise and undisturbed coolant delivery even at low pressures in nearly all component materials

Application overview



The following Application overview pages will provide a good insight of the usage of toolholders and inserts from an application perspective. It should also be said and recommended to look into the Seco Suggest or explore the opportunities directly on www.secotools.com/suggest at any webbrowser.

Chipbreaker application areas – positive inserts

The chart below is to visualize three critical design elements in one diagram for positive basic shape inserts.

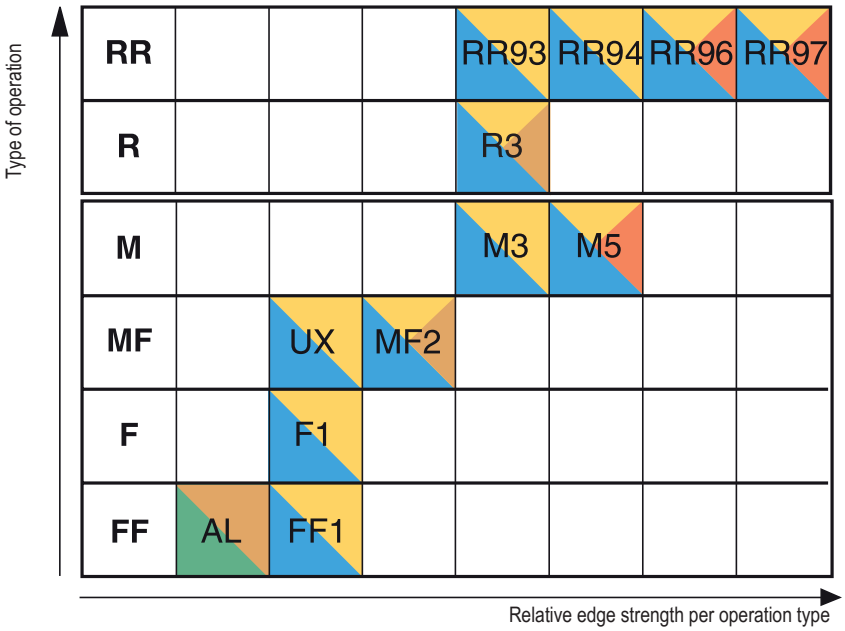
The first element is seen on the left side of the diagram with the following letters and explanations

F = Finish turning

M = Medium turning

R = Rough turning

and combinations thereof, also indicated in the description of the chipbreaker.



The second element is seen in the lower part of the diagram: A relative edge strength value, also indicated in the description of the chipbreaker.

The third element is the color code indicating the ISO workpiece material area as per the table and examples below and for each chipbreaker in the diagram further decribed below.

Indicative ISO classification of the grades

Steel **P**	All kinds of steel and cast steels except stainless steels with austenitic structure.	P01, P10, P20, P30, P40, P50
Stainless steel **M**	Stainless austenitic and austenitic/ferritic steel and cast steel.	M01, M10, M20, M30, M40
Cast iron **K**	Grey cast iron, cast iron with spheroidal graphite, malleable cast iron.	K01, K10, K20, K30, K40
Non-ferrous metals **N**	Aluminium and other nonferrous metals.	N01, N10, N20, N30
Superalloys and titanium **S**	Heat resistant special alloys based on iron, nickel and cobalt, titanium and titanium alloys.	S01, S10, S20, S30
Hard materials **H**	Hardened stel and cast iron materials, chilled cast iron.	H01, H10, H20, H30

Superalloys (ISO S)

Chipbreaker application areas – negative inserts

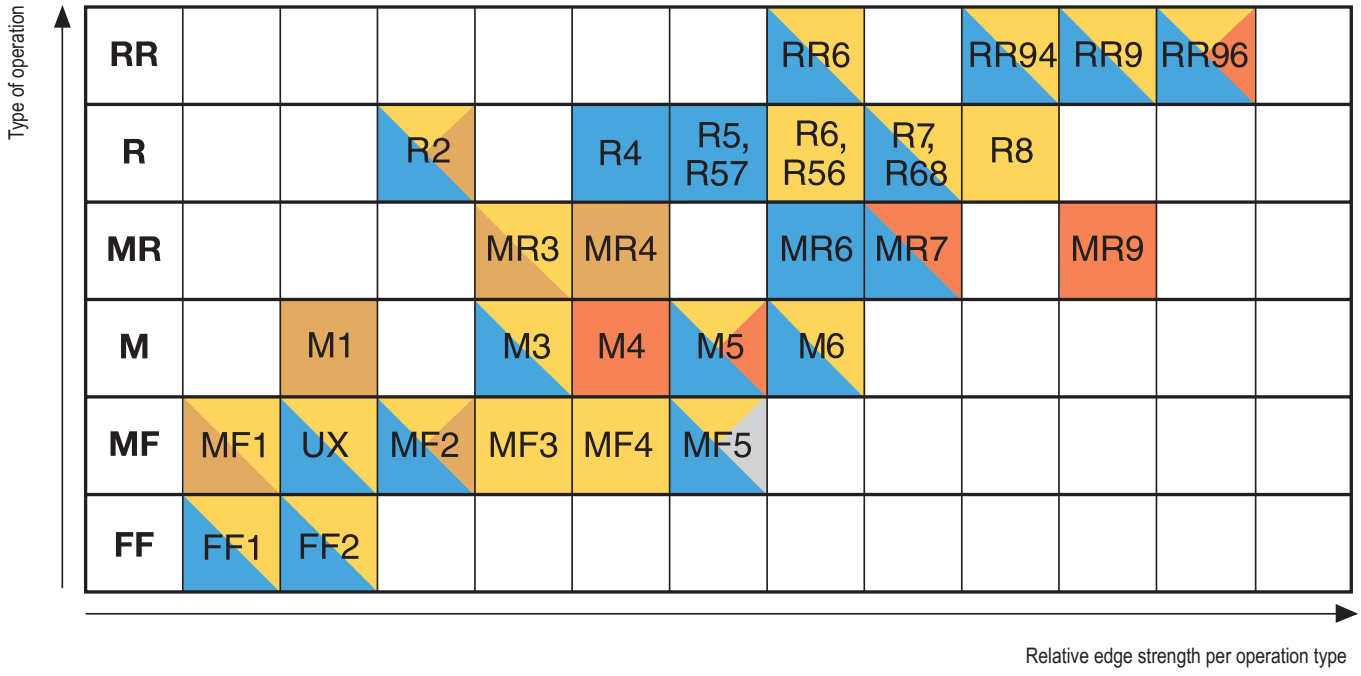
The turning chipbreakers are designed to give the proper edge geometry for different application areas. The product designs are considering capability in chipbreaking, chipcontrol, edge toughness behavior, edge line integrity as well as the overall turning work to be done such as rough and finish turning for certain workpiece materials.

The idea with the chart below for negative basic shape inserts is to visualize three of these design elements in one diagram.

The first element is seen on the left side of the diagram with the letters

F = Finish turning

M = Medium turning



R = Rough turning

and combinations thereof also indicated in the description of the chipbreaker.

The second element is seen in the lower part of the diagram: A relative edge strength value, also indicated in the description of the chipbreaker.

The third element is the color code indicating the ISO workpiece material area as per the table on the previous page and examples below.

Chipbreaker chart for negative basic shape inserts

Superalloys (ISO S)

MF2 — Steel (ISO P)
Stainless steel (ISO M)
Superalloys (ISO S)

MF4 — Stainless steel (ISO M)

MF5 — Steel (ISO P)
Stainless steel (ISO M)
Hardened steel (ISO H)

M1 — Superalloys (ISO S)

M5 — Steel (ISO P)
Stainless steel (ISO M)
Cast iron (ISO K)

MR7 — Steel (ISO P)
Cast iron (ISO K)

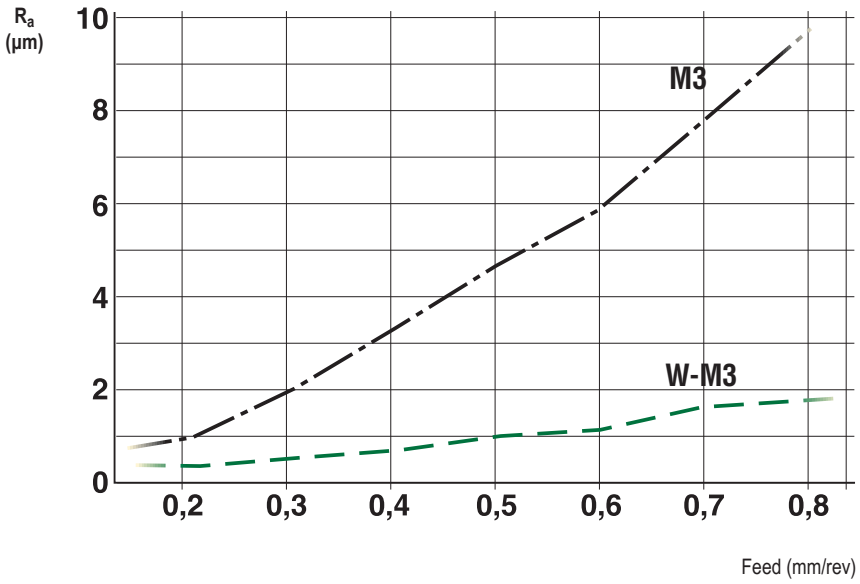
MR9 — Cast iron (ISO K)

R4 — Steel (ISO P)

High Feed Wiper inserts – brief introduction

For the turning professional with an ambition to have higher effectiveness and efficiency, especially when looking at chipbreakers and connecting back to insert shapes there is a need to mention High Feed Wiper inserts.

Seco High Feed Wiper Inserts offer either



– Excellent surface finish and productivity at high feed rates

or

– Superior surface finish at normal feed rates

W	N	M	G	06	04	08	W	-	M3
1	2	3	4	5	6	7	8		12

Seco has a high feed wiper offering in inserts for most applications such as Advanced Materials and can for example be recognized by the ”W” in the edge property “position 8” in the ISO insert Code Key as indicated above.

The outcome from using a High Feed Wiper insert can actually even eliminate the need for a separate finishing cut, which is indicated and decribed below.

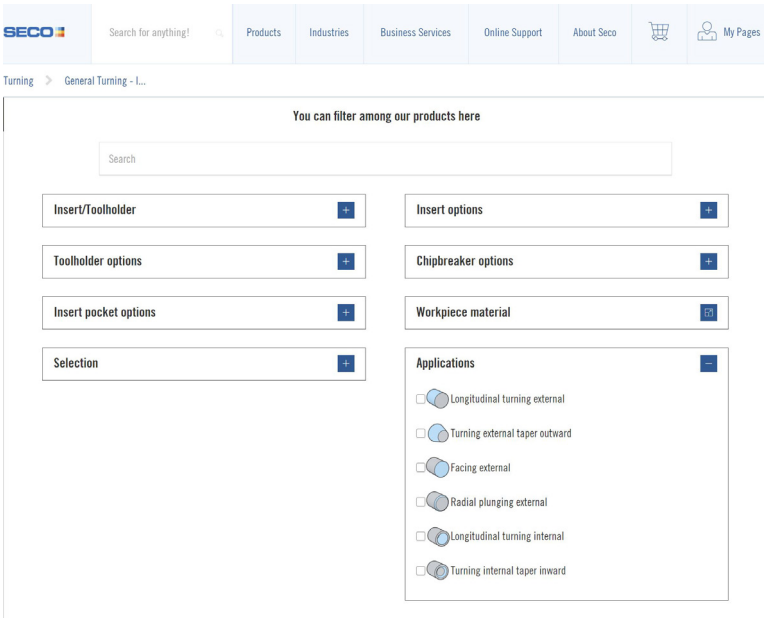
According to the diagram above Seco High Feed Wiper Inserts (in this case CNMG120408W-M3, TP2501) shows an outcome with superior surface finish in R_a (see Y-axis) achieved in steel turning compared to standard insert (in this case CNMG120408-M3, TP2501).

For clarity the conditions for the test were 1mm depth of cut and cutting speed adjusted according to recommendations depending of feed used in SMG P4 longitudinal steel turning. Further details can be found exploring for example the www.secotools.com (see follwing pages).

Searching Turning Tools

To complement this present catalogue there are several ways to connect to www.secotools.com which help you make the use of your tools from Seco.

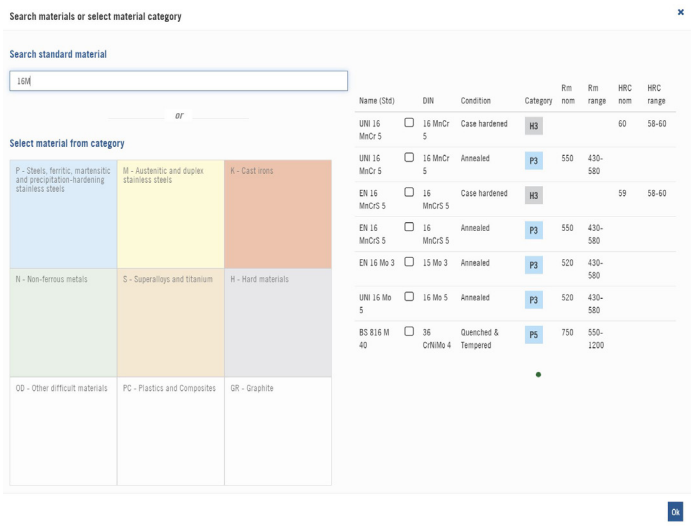
The webpage of www.secotools.com contains several entries like "Search for anything" including direct Product Search as well as the sequencial route by clicking "Products" in the head-banner according to the below image, ending up in the view shown to the next page.



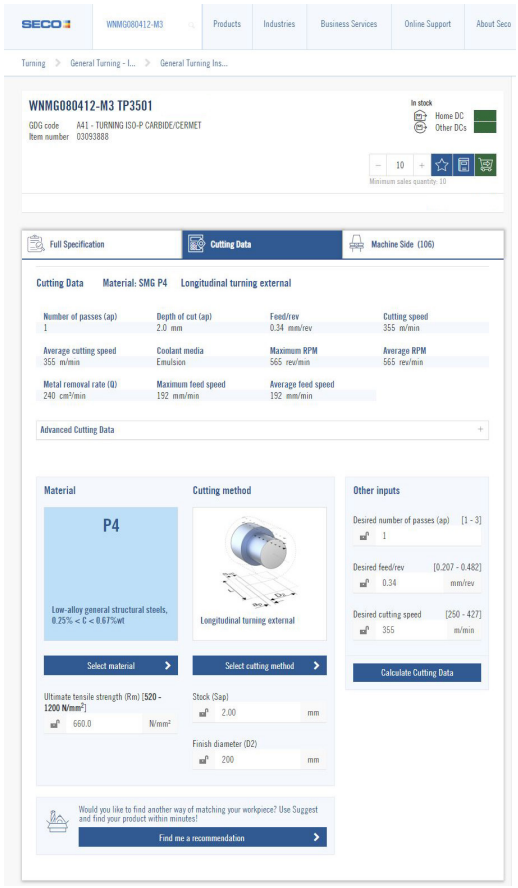
Under products you find overall applications and the Turning subgroups easily.

However, the "Search for anything" field in the heading gives instant access to many things available at www.secotools.com especially if you want to know more about the topic or tool you are looking for.

It is recommended to try yourself by reading the QR-code in the upper right corner on present page for easy access alternatively search by Designation, Item-number, Grade or Type in www.secotools.com in any webbrowser or download and use link functionality of the Seco Assistant application, available in the Google Playstore or Apple App-store.



Searching using filter options



If a Turning subgroup is chosen such as General Turning – ISO (previous page) you enter a filtering view (above) where several options open up, principal application types and workpiece materials in addition to all available features on inserts, chipbreakers and toolholders.

There are opportunities to expand each filter section by pressing the right-most ”plus” as indicated above for the ”Application”-section of the filter.

Exploring cutting data recommendations

After filtering and choosing a specific product or directly product-searched an insert (in this case WNMG080412-M3,TP3501), the product specific information is accessed such as availability of stock and cutting data recommendations for the specific product (refer to the screenshot on the left).

However, there are many things to explore even when looking only at the cutting data view (lower left).

For example in the lower part of cutting data sheet there are options to refine the cutting data in order to get closer to any specific operation in particular. For example, the stock to be removed, number of passes estimated, or to adjust to the actual tensile strength of the steel. After you have made these changes, you can click on “Calculate Cutting Data”, and the cutting data view will be updated accordingly.

For the turning professional there is also an ”Advanced Cutting Data” section available when logged into MyPages.

This section will expand when clicking anywhere within the marked row.

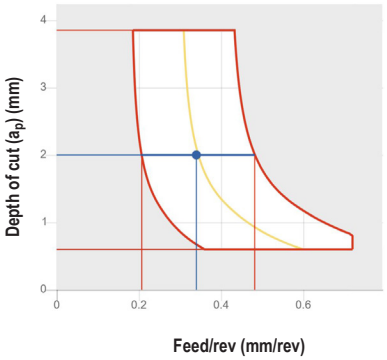
Once you expand the “Advanced Cutting data, you will have access to change actual limitations such as ”RPM”, ”Machine Power” and ”Operation type – finishing” entering a surface finish requirement to come even closer to actual and specific application conditions.

Once again it is recommended that you try these yourself by reading the QR-code in the upper right corner for easy access alternatively search or type in directly www.secotools.com in a webbrowser.

If you are at the machine and not have access to a computer, you can find cutting data or machining calculators in the Seco Assistant app (see separate QR-code).

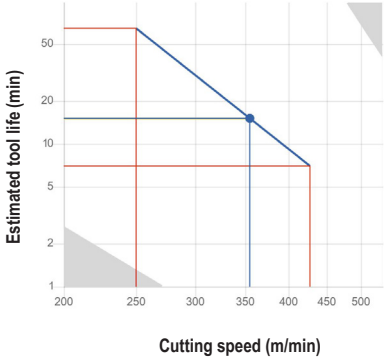
However also as indicated to the left there is further help for the turning professional to explore how to achieve maximum effectiveness and efficiency out of turning operations as long as you are logged in.

By further expanding into ”Cutting Data Graphs” the dynamic graphs for the specific insert selected (in this case WNMG080412-M3 / *WNMG433-M3*, TP3501) give further detail visualizing (however not limited to) the recommended use of the insert. Generally the graphs show ranges for the basic cutting data together with the current result and the applicable constraints.



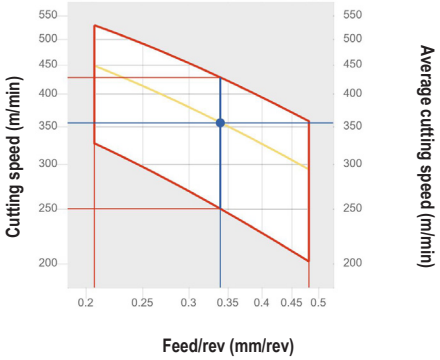
To the upper left there is a graph of the ”Working Range” indicating the recommended depth of cut and feed range.

In the center the ”Taylor-curve” diagram connects the estimated tool life and cutting speed recommendation for the chosen SMG category workpiece material and insert combination.

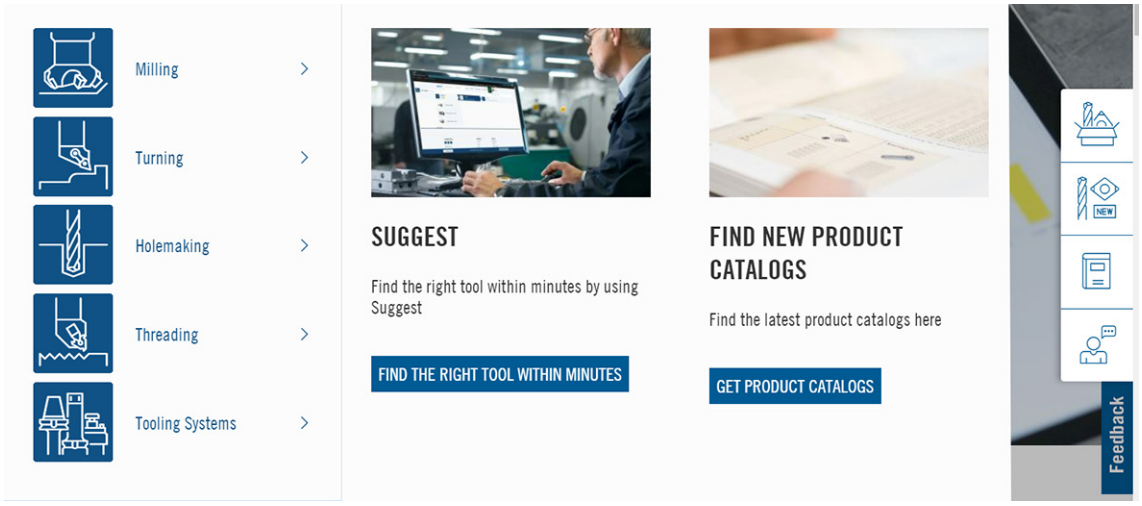


To the very right the ”Speed Range” graph indicates the relationship between recommeded speeds and feeds.

The turning professional should be aware that there are options to introduce contraints such as “Machine Power”, “RPM” and “Surface finish” in cutting data calculations. Consequently these kinds of constraints will then appear in graphs such as the below shown. It is highly recommended to try and explore how cutting calculations and cutting data graphs can provide insight and understanding for easier problem solving and during preparations of turning applications.



Working range $a_p(f)$



Taylor TL(v_c)

Speed range $v_c(f)$

Component based product recommendations

When starting from and considering a component instead of going directly to a turning product it is highly recommended that you use the Seco Suggest to search for tool recommendations based on principal components, applications and requirements. Below the entry view of Seco Suggest.

Please also note the four shortcut icons to the right of the screen shot above where Seco Suggest also can be accessed directly. Those are recommended to try yourself via reading the QR-code in the upper right corner for easy access by cell phone alternatively search or type in www.secotools.com as well as in your computer webbrowser or download and use this functionality in our new Seco Assistant application, available in the Google Playstore or Apple App-store.

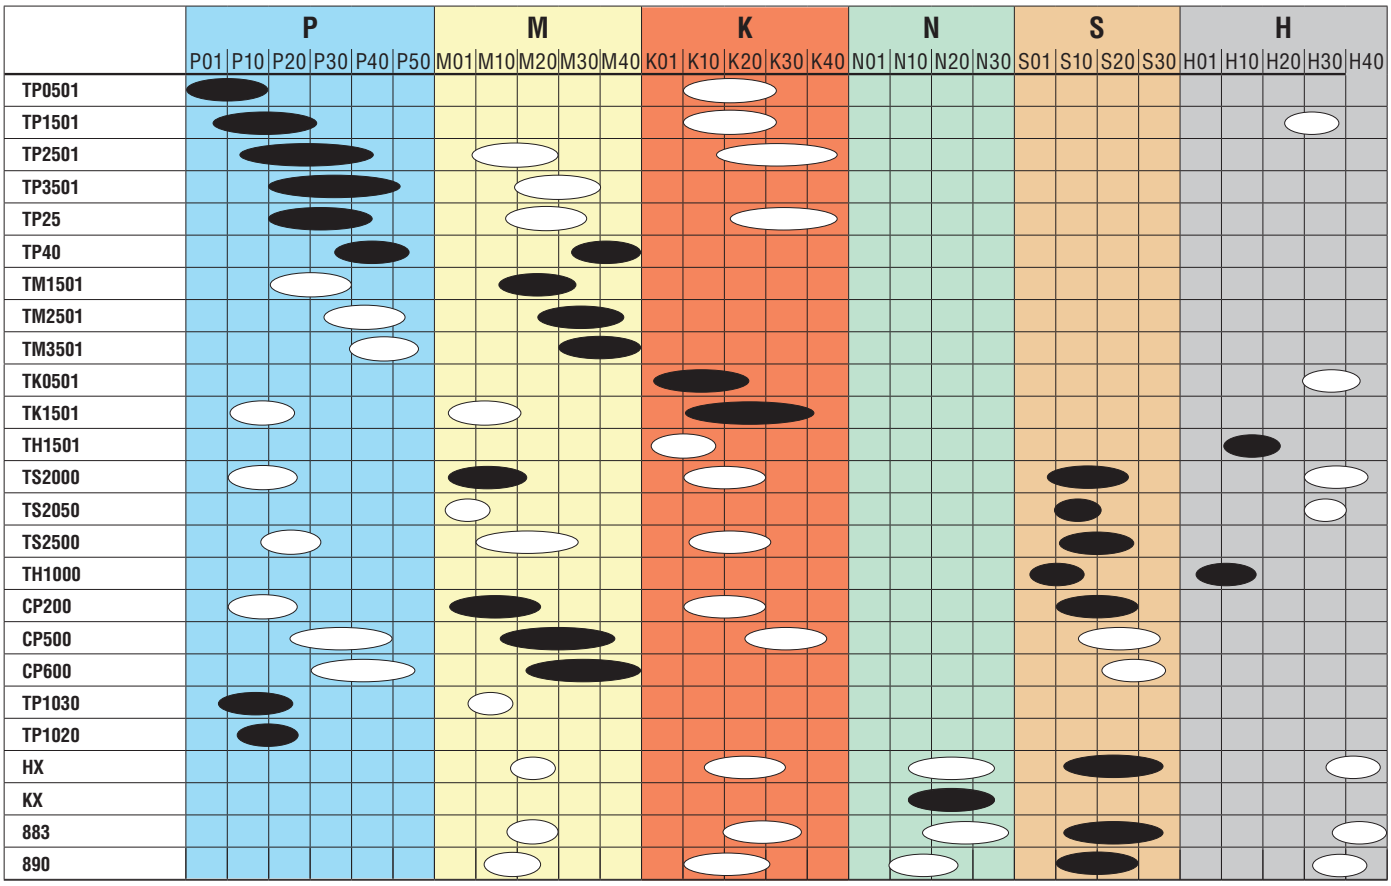
Insert grades – Carbide

To say that the choice of a grade everytime is easy may be an exaggeration, but there are easy rules of thumb to be used using the diagram below as a starting point.

If you are looking for the first choice grade, you could follow this methodology:

1. Start from the type of workpiece material. For example, in the table below, for steel, the ISO-P grades are the first choice.

2. You should look for black application coverage areas below first which indicate grades first of all designed for the application area then white for the complementary areas.



3. Then there are application divisions based on an ISO platfrom from center to i.e. for example P25 towards higher P35 which means tougher requirements and lower cutting speeds or P15 towards higher speeds or often higher surface requirements.

4. When one of the promising option chosen follow the row to the left i.e. if looking at medium turning with medium size inserts P25 the first choice would be Duratomic TP2501, but considering as high requirement on reliability but more versatility and less productivity focus the TP25 could be an option.

This is a straight-forward method giving a good first choice but there are several ways to address a skilled turning artesans' needs.

Indicative ISO classification of the grades

Steel **P**	All kinds of steel and cast steels except stainless steels with austenitic structure.	P01, P10, P20, P30, P40, P50
Stainless steel **M**	Stainless austenitic and austenitic/ferritic steel and cast steel.	M01, M10, M20, M30, M40
Cast iron **K**	Grey cast iron, cast iron with spheroidal graphite, malleable cast iron.	K01, K10, K20, K30, K40
Non-ferrous metals **N**	Aluminium and other nonferrous metals.	N01, N10, N20, N30
Superalloys and titanium **S**	Heat resistant special alloys based on iron, nickel and cobalt, titanium and titanium alloys.	S01, S10, S20, S30
Hard materials **H**	Hardened stel and cast iron materials, chilled cast iron.	H01, H10, H20, H30

The black areas in the chart indicate an insert's main ISO application groups and the white areas indicate other supplementary application groups.

An alternative would be to try finding a recommended solution in Seco systems yourself by reading the QR-code in the upper right corner for for easy access alternatively web-search or type in www.secotools.com/suggest in your webbrowser.

Introduction – PCBN

Polycrystalline Cubic Boron Nitride (PCBN) is a material which is sintered at extremely high pressure and high temperature into a wear-resistant material with properties close to those of diamond. Due to the hot hardness, oxidation resistance and fracture toughness of the material, inserts made of PCBN have excellent edge strength and long tool life when machining hard ferrous materials and pearlitic grey cast iron.

Secomax™ PCBN inserts are suitable for machining:

– Hardened steel (including hard-facing alloys)

– Pearlitic grey cast iron

– Chilled and white cast iron

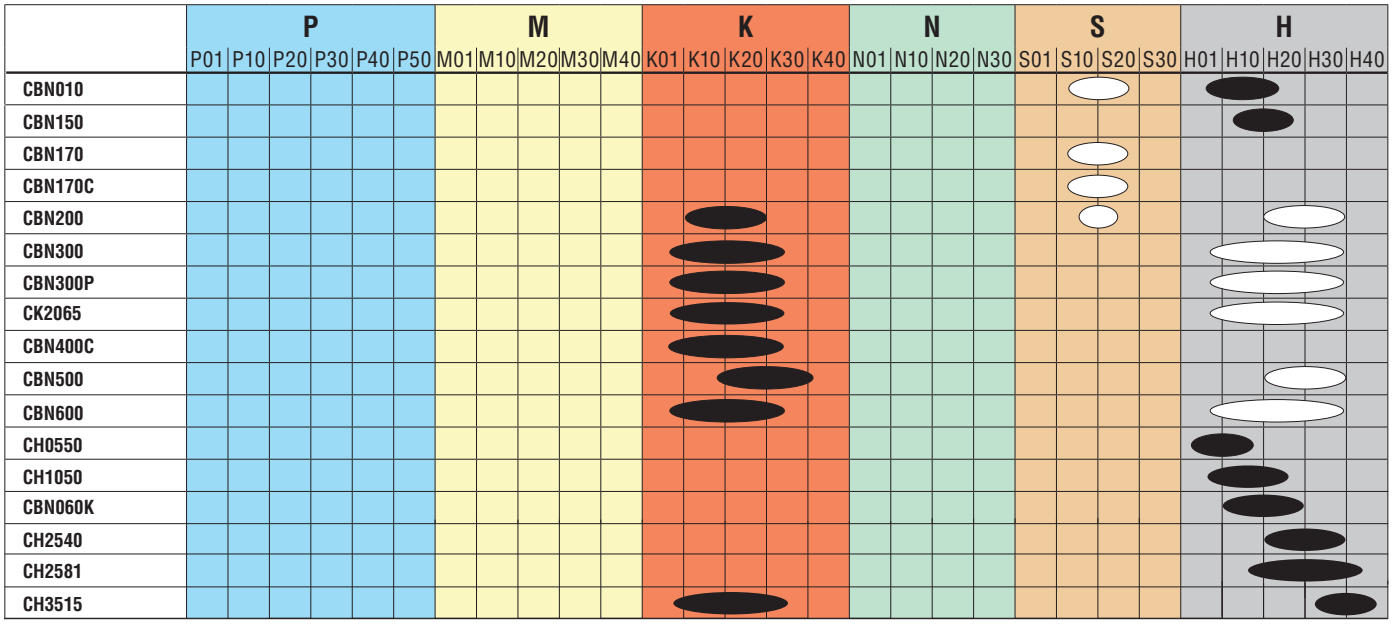
– Manganese steel

– Cemented carbide

– Valve seat materials

– Powder Metallurgy (PM) alloys

– Nickel-based superalloys e.g. Inconel 718



For more information including a comprehensive guide to understanding and applying PCBN successfully, please ask your sales representative for the Secomax™ PCBN, Technical Guide (available in English).

Insert grades – PCBN

The Secomax™ PCBN range of grades consists of both coated and uncoated grades.
The application areas for the Secomax™ grades are shown below.

Indicative ISO classification of the grades

Steel **P**	All kinds of steel and cast steels except stainless steels with austenitic structure.	P01, P10, P20, P30, P40, P50
Stainless steel **M**	Stainless austenitic and austenitic/ferritic steel and cast steel.	M01, M10, M20, M30, M40
Cast iron **K**	Grey cast iron, cast iron with spheroidal graphite, malleable cast iron.	K01, K10, K20, K30, K40
Non-ferrous metals **N**	Aluminium and other nonferrous metals.	N01, N10, N20, N30
Superalloys and titanium **S**	Heat resistant special alloys based on iron, nickel and cobalt, titanium and titanium alloys.	S01, S10, S20, S30
Hard materials **H**	Hardened stel and cast iron materials, chilled cast iron.	H01, H10, H20, H30

The black areas in the chart indicate an insert's main ISO application groups and the white areas indicate other supplementary application groups.

Introduction – PCD

Polycrystalline Diamond (PCD) is produced by sintering together carefully selected particles of diamond under conditions of high temperature and high pressure. PCD cutting tools combine the hardness, abrasion resistance and thermal conductivity of diamond with the toughness of tungsten carbide.

Secomax™ PCD inserts are suitable for machining non-ferrous metals and alloys, e.g.:

– Aluminium
– Copper
– Brass
– Bronze

It can also be used for other materials, e.g.:

– Composites (MMC, ...)
– Reinforced plastics
– Graphite
– Cemented/tungsten carbide
– Ceramics
– Titanium alloys

Indicative ISO classification of the grades

Steel **P**	All kinds of steel and cast steels except stainless steels with austenitic structure.	P01, P10, P20, P30, P40, P50
Stainless steel **M**	Stainless austenitic and austenitic/ferritic steel and cast steel.	M01, M10, M20, M30, M40
Cast iron **K**	Grey cast iron, cast iron with spheroidal graphite, malleable cast iron.	K01, K10, K20, K30, K40
Non-ferrous metals **N**	Aluminium and other nonferrous metals.	N01, N10, N20, N30
Superalloys and titanium **S**	Heat resistant special alloys based on iron, nickel and cobalt, titanium and titanium alloys.	S01, S10, S20, S30

Introduction – Ceramic

Secomax ceramics include a range of products developed to meet the manufacturing industries ever increasing demands on productivity and product performance.

The inserts are die-pressed and sintered by a HIP process using very fine and pure raw materials with fine microstructure to reach excellent material properties. All surfaces are then ground ensuring a product with superior dimensions and tolerances.

This comes together in a product with outstanding features:

– high thermal shock resistance

– optimised fracture toughness

– excellent wear resistance

– high product quality

Application areas

Heat resistant superalloys (HRSA) include a broad range of nickel, iron and cobalt based alloys developed specifically for applications demanding exceptional mechanical and chemical properties at elevated temperatures.

Seco ceramic inserts are intended for rough machining of nickel based heat resistant superalloys. The most common nickel based superalloy is Inconel 718, which is a precipitation hardenable nickel chromium alloy containing significant amounts of iron, niobium and molybdenum along with lesser amounts of aluminium and titanium.

Other common nickel based superalloy names are:

– Hastalloy

– Haynes (Waspaloy)

– MAR

– Nimonic

– Rene

– Udimet

Indicative ISO classification of the grades

Steel **P**	All kinds of steel and cast steels except stainless steels with austenitic structure.	P01, P10, P20, P30, P40, P50
Stainless steel **M**	Stainless austenitic and austenitic/ferritic steel and cast steel.	M01, M10, M20, M30, M40

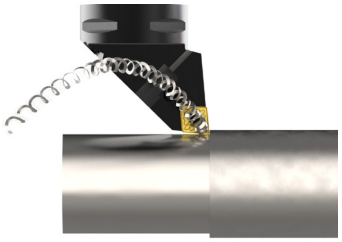
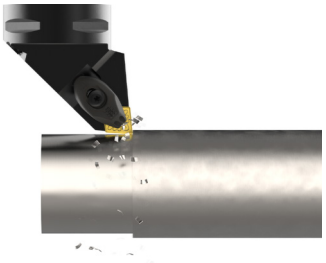
Turning problems & recommended solutions



Search and install the Seco Assistant App on AppStore or GooglePlay. Please explore the app for example Utilities and connected to this page Tool Optimization under Turning. The Seco Assistant App provide a more complete list of recommended solution options.

Too long unstable chips (e.g. risks for tangling)

One of the main concerns even for the turning professional is the chipcontrol often concerning chipbreaking. Here is how to start:



Too long unstable chips (e.g. risks for tangling)

1. Try increasing the feed rate and/or depth of cut
2. Change to a more suitable tighter chipbreaker. Use the chart on page(s) 60-61 and choose one below or to the left of the one in present use or search a recommended insert via www.secotools.com/suggest
3. Start the Seco Assistant app. Check under Utilities/Tool Optimization/Turning/Poor chip control for a more complete list of options.

Too hard-curled very short chips (e.g. risks for excess heat)

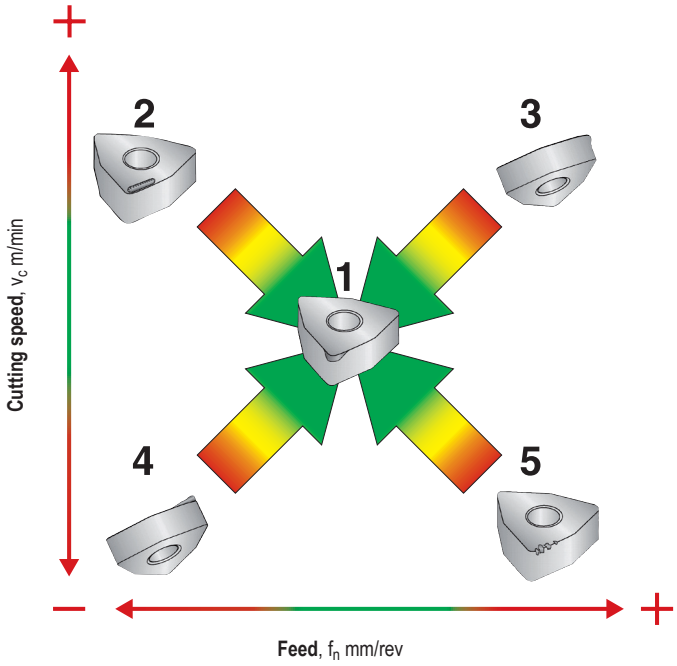
1. Try lowering the feed rate and/or depth of cut
2. Change to a more suitable open chipbreaker. Use the chart on page(s) 60-61 and choose one above or to the right of the one in present use or search a recommended insert via www.secotools.com/suggest
3. Start the Seco Assistant app. Check under Utilies/Tool Optimization/Turning/Hard chip control for a more complete list of options

Too much vibrations (e.g. risk marks and breakages)

1. Secure workpiece clamping and tools
2. Try changing cutting speed and/or feed
3. Reduce the depth of cut
4. Select a more easy-cutting chipbreaker. Use the chart on page(s) 60-61 and choose one often left of the present in use or search recommended products via www.secotools.com/suggest
5. Start the Seco Assistant app. Check under Utilies/Tool Optimization/Turning/Vibrations for a more complete list of options

Poor surface finish (e.g. risk not reaching requirements)

1. Reduce the feed rate
2. Increase cutting speed
3. Select a high-feed Wiper insert chipbreaker in accordance to the code key then use the product-search feature at www.secotools.com or search recommended products via www.secotools.com/suggest
4. Start the Seco Assistant app. Check under Utilies/Tool Optimization/Turning/Poor surface finish for a more complete list of options



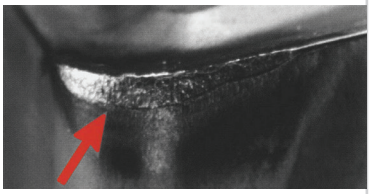
Optimization – Wear

When optimizing tool life for coated carbide grade inserts we ought to look at and consider wear behavior which to a high degree relates to the workpiece material and conditions for a turning application.

A general straight-forward method to achieve optimimum tool life could be described as the below chart as long as there are freedom to change cutting speed and feed rate. However it requires some insight in insert wear as in the picture indicated below, but most turning professionals have to consider that any severe wear process may end up with a fracture.

The diagram below should be read in the following way for example if you find plastic deformation as indicated in “3” you should reduce the feed and/or speed to have a stable flank wear as indicated in “1” to get long tool life.

1. Flank wear
2. Crater wear
3. Plastic deformation
4. Built-up edge
5. Chipping, Fracture



Insert wear and failure modes

When in need to go in more depth on the topic of wear of coated carbide insert and solve challenges based on wear processes the following collection will provide a comprehensive platform.

Please install the Seco Assistant App on AppStore or GooglePlay and explore the app under Utilities and Tool Optimization under Turning. Here you will find a more complete list of recommended solution options.

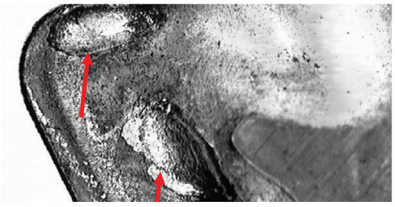
Normal flank wear

The normal flank wear, since it is uniform, predictable and dependable, is the most desirable wear mode.

Cause

Abrasive wear. Hard microscopic inclusions often of carbides at workpiece material surface in contact with insert cut into the insert. In some cases fractions of non-contained microscopic hard particles that cannot be retained in a matrix may tumble between surfaces in contact and also cut into the insert. An irregular flank wear that initially may look uniform, as well as too rapid though uniform flank wear, prematurely reaching a set target wear criterion, requires a corrective action in some form.

What to look for
– Relatively uniform abrasion along the cutting edge
– Non-uniform appearance may indicate influence of other wear modes (see other wear descriptions)
Note: Metal from the workpiece can be smeared over the cutting edge and can exaggerate the apparent size of the wear scar.



When to expect it
– In all materials, an insert will finally fail due to normal flank wear if it doesn't fail from something else first.

Corrective actions (to rapid flank wear)
– Select a more wear resistant, harder, or coated carbide grade
– Reduce the cutting speed (or RPM)
– Apply coolant correctly
– If possible, select insert with larger radius

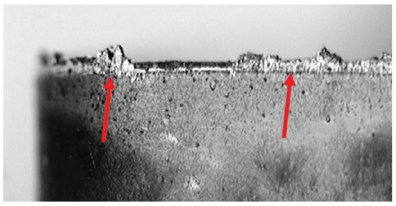
Crater wear

Cause

A combination of chemical diffusion, decomposition and abrasive wear causes cratering. Classically, the heat from workpiece chips decomposes the tungsten carbide grains in the substrate, and carbon leaches into the chips (diffusion), creating a 'crater' on the top surface or rake face of the insert. The crater will eventually grow large enough to cause the insert to fail e.g. by chipping or rapid flank wear. Modern coating technology such as Duratomic® has reduced this wear mode drastically, but when trying to improve the productivity, using higher cutting data, it inevitably appears again.

What to look for
– Craters or pits on the top or the rake face of the inserts
– Chipbreaking may change to better or worse after cratering started

When to expect it
– Iron or titanium-based alloys



Corrective actions
– Use wear resistant grades and if needed try another grade with other coating design
Or reduce heat by…
– Using coolant
– Using a freer cutting geometry
– Reducing the cutting speed (or RPM)
– Changing feed rate

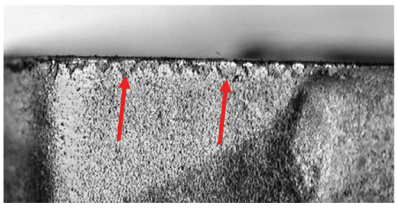
SecoAssistant App

Built-up edge

Cause

Material adhesion. Built-up edge (BUE) is a result of the workpiece material being pressure welded to the cutting edge. This could be an indicator of exit conditions from cutting in workpiece materials with high chemical affinity, high cutting forces/pressure, and locally insufficient temperature around the cutting zone. The wear mode itself could in some cases even be beneficial for tool life, but the consequence of built-up edge breaks off and allows chips to bring pieces of the insert with it or acting as an indicator of chipping, notching or other discontinuous wear modes, makes it important.

What to look for
– Shiny material on the top or flank of the insert edge
– Erratic changes in part size or surface finish



When to expect it
– High temp alloys and stainless steel and other workpiece materials appearing 'gummy'
– At relatively low speeds especially at limited cuts e.g. facing to center & parting-off and even more apparent in the centre of a drill

Corrective actions
– Change of grade to other coating designs may reduce built-up edge.
– Increase the cutting speed (or RPM) or increase the feed rate
– Try an insert with a sharper cutting edge geometry
– Apply coolant correctly or not at all; perhaps do another check on the emulsion concentration

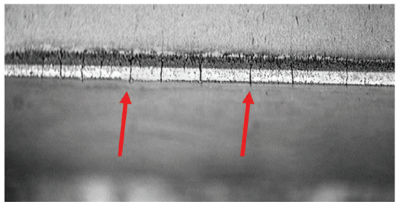
Chipping

Cause

Mechanical instability or material adhesion. Chipping of the insert edge could be a result of vibrations in the work-piece or spindle. Larger hard inclusions in the material being cut and interrupted cuts may result in local stress concentrations that can cause chipping. In addition adhered material may cause a tensile stress that on removal can tear off parts of an insert.

What to look for
– Chipping along the edge of the insert

When to expect it
– Non-rigid set-ups (bad bearings, worn spindles, etc.)
– Demanding entrance and exit conditions
– Hard spots at well as soft spots in work materials
– Powder Metallurgically (PM) made materials



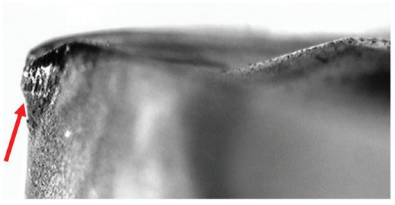
Corrective actions
– Ensure rigid machine tool setup
– Change over to tougher insert grade or stronger cutting edge geometry
– Reduce the feed rate
– In some cases, turn-off the coolant
– See also corrective actions for built-up edge

SecoAssistant App

Thermomechanical failure

Cause

A combination of thermal cycling (frequency changing the working temperature for the insert rapidly), thermal load (amount of heat), thermal shock (fast temperature change from warm to cold and the other way around in different zones), and mechanical shock (stress change from release to full load) causes thermo mechanical failure. Stress cracks form along the insert edge, eventually causing sections of carbide to pull out and appear to be chipping. Seen most commonly in milling.



What to look for
– Multiple cracks perpendicular to cutting edge
– Irregular chipping on edges or wear spots on rake face

When to expect it
– Intermittent cuts e.g. facing over slots, but also tool paths when machining a large number of parts creating the thermal cycling or intermittence in coolant flow

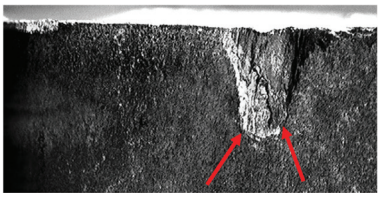
Corrective Actions
– Apply coolant differently or not at all
– Select a tougher grade
– Reduce the cutting speed (or RPM) or reducing the feed rate
– Use a free-cutting geometry or chipbreaker to reduce heat

Edge deformation

Cause
Thermal overloading. Excessive heat causes the carbide binder (cobalt) to soften. It could come in combination with mechanical overloading where the pressure of the insert against the workpiece all in all making an insert edge deform partly or fully, eventually breaking off or leading to irregular flank wear.

What to look for
– Deformation at the cutting edge or excessive irregular flank wear
– The dimensions of the workpiece may change drastically

When to expect it
– High speed and/or high feed rates
– Hard steels or work-hardened surfaces
– High temperature superalloys or stainless steels



Corrective actions
– Apply coolant correctly
– Try a harder, more wear resistant grade
– Reduce cutting speed (or RPM) or reduce the feed rate
– Select an insert with other geometric features

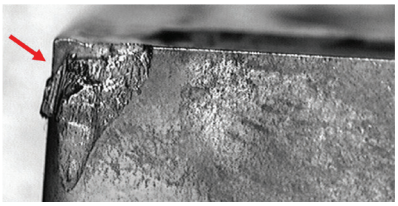
SecoAssistant App

Notching

Cause

Combinations of local properties in workpiece materials and cutting conditions. Notching is often caused by the conditions at the surface of the workpiece e.g. surface hardening from previous cuts, forged or cast surfaces, or surface scale. This causes the insert to wear more rapidly in that part of the cutting zone. Local stress concentration can also lead to notching as a result of the compressive stress along the cutting edge and lack of the same behind the cutting edge – the insert is particularly affected at the depth of cut.

What to look for
– Notching or clusters of chippings for example at the depth of cut area on the insert
Note: The notch could be of two kinds; the smoother which indicate more chemical/abrasive interaction or the irregular more mechanical/adhesive extensive chipping.



When to expect it
– Materials with surface scale or oxidation
– Work hardening materials
– Cast or other process affected surfaces

Corrective actions
– Vary the depth of cut
– Adjust the feed rate or increase cutting speed (Note: This will generate more flank wear)
– Select a tougher insert grade
– Exchange chipbreaker design drastically
– Prevent built-up edge

Mechanical fracture

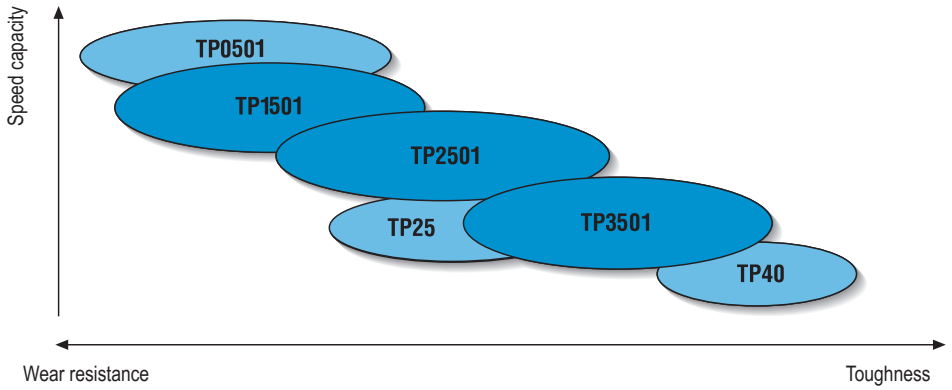
Cause

Excessive load (also caused by other wear modes than finally) can cause mechanical fracture. Mechanical overload could of course cause the insert to break from the first moments in a cut to the exit or even after the release from cut. To be considered are also surrounding cutting conditions such as the conditions of the shim, workpiece clamping or machine condition.

What to look for
– Fracture of insert (e.g appearing as irregular flank wear often at the insert radius)
– Sudden increase of cutting force level

When to expect it
– Inhomogeneous workpieces e.g. with major inclusions, pores or design features that cause heavy impact or load release
– Unstable cutting conditions
– Low cutting data especially cutting speed

Corrective actions
– Reduce the feed rate or the depth of cut
– Increase speed
– Verify set-up rigidity
– Select a tougher insert grade or a more secure insert or cutting edge
– If possible reduce workpiece's inclusions and difficult geometrical features

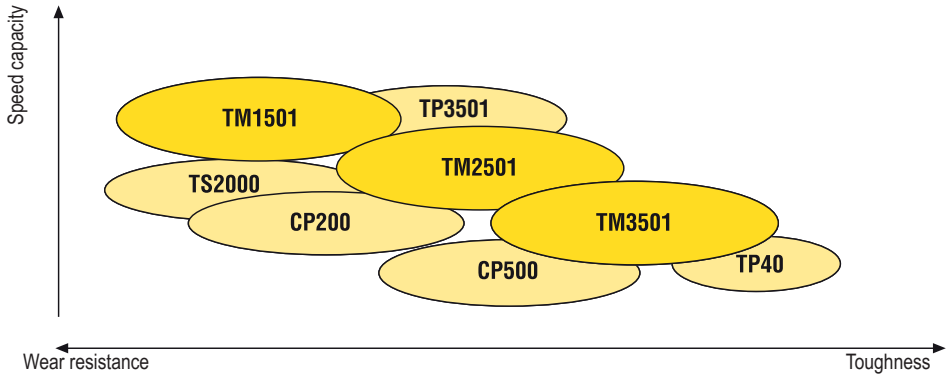


Optimisation – Grades

SecoAssistant App

However when considering wear there are limitations as well as property relations for each and between every grade even though Duratomic grades have redefined the actual opportunities considering productivity and tool life.

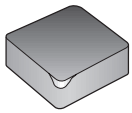
When looking a the simple coated cemented carbide grade overview for steel turning in the chart below, you can see that the TP2501 grade is placed in the center corresponding to the P25 application area referred earlier. However, in this chart, the speed capabilities of different grades and their wear properties are illustrated with more clarity.

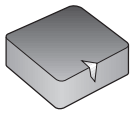


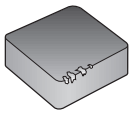
Steel

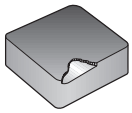
That means a chain of property relations could guide you towards a more insightful choice e.g. if you are after dry continuous steel turning TP0501 is a good choice, but lower speed medium turning application TP25 is better.

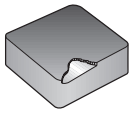
When instead, looking at the simple coated cemented carbide grade overview for stainless steel turning area below the number of grades introduced in the diagram have grown. However, the pattern where TM2501 is placed in the center, corresponding to the M25 application area can be recognized.

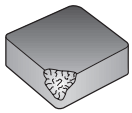


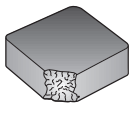




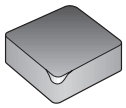


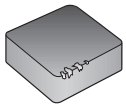






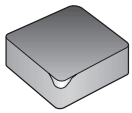
Stainless steel

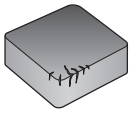


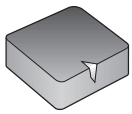


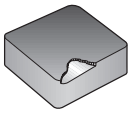
The well connected TM1501, TM2501 and TM3501 Duratomic grade chain covers applications in stainless steel turning, but also the thin PVD-coated TS2000, CP200 to CP500 complements the above high productivity CVD grades with reliability, but not at as high speeds as the Duratomic grades.

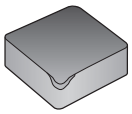
On the other hand TP3501 has been designed to have complementary properties to work well in stainless steels despite the grade was developed for steel turning.

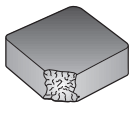












Troubleshooting – PCBN

Problem	Cause	Suggested action(s)
Flank wear 	• Not correct edge temperature	• Increase cutting speed • Increase feed rate • Increase depth of cut • Check cutting tool centre height • Check the ferrite content
Crater wear 	• Not correct edge temperature	• Decrease cutting speed • Decrease feed rate • Reduce chamfer angle • Use E edge preparation • Use coated insert • Use coolant (only in continuous cut)
Notch wear 	• Not correct edge temperature • Too high cutting forces	• Increase cutting speed • Decrease feed rate • Increase insert approach angle (preferably round inserts) • Vary the depth of cut • Use inserts with chamfered cutting edges
Edge chipping 	• Too high cutting forces	• Use inserts with chamfered cutting edges • Increase system rigidity • For interrupted cuts, chamfer the tool entry/exit slots and holes • Vary the cutting speed to eliminate vibrations
Edge flaking (continuous cut) 	• Too high cutting forces	• Increase cutting speed • Reduce feed rate • Use chamfered and honed cutting edges • Check cutting tool center height • Reduce insert approach angle
Edge flaking (interrupted cut) 	• Too high cutting forces	• Do not use coolant • Use chamfered and honed cutting edges • Reduce feed rate • Increase cutting speed • Check cutting tool centre height • Reduce insert approach angle
Edge breakage 	• Too high cutting forces	• Reduce depth of cut • Reduce cutting speed • Increase nose radius • Use chamfered and honed inserts • Check cutting tool center height
Insert breakage 	• Too high cutting forces	• Check insert seating • Check insert shim and insert clamp • Check cutting tool centre height

Troubleshooting – PCD

Problem	Cause	Suggested action(s)
Flank wear 	• Wrong grade • Presence of Fe/Ni/Co	• Change to coarser PCD grade • Check material composition • Reduce cutting speed • Use coolant
Built-up edge 	• Not correct edge temperature • Wrong grade	• Decrease or increase cutting speed • Choose a sharper insert • Change to a finer grade
Edge chipping 	• Poor rigidity • Wrong grade • Incorrect cutting data • High run-out	• Minimize vibrations • Change to a tougher grade • Change cutting data • Check set-up
Poor surface finish	• Wrong grade • Too high cutting data • Incorrect wiper position	• Change to a finer PCD grade • Reduce cutting speed and feed rate • Check wiper position
Flaking of workpiece	• To high depth of cut	• Decrease depth of cut • Add entry chamfer on component

Troubleshooting – Ceramics

Problem	Cause	Suggested action(s)
Flank wear 	• Excessive feed rate and cutting speed	• Reduce cutting speed • Use larger corner radius • Use high wear-resistant grade
Crater wear 	• Excessive feed rate and cutting speed	• Reduce cutting speed • Use smaller lead angle • Check edge geometry
Thermal cracking 	• Severe cycle of heating & cooling during cutting • Excessive feed rate and cutting speed	• Change to dry machining • Reduce cutting speed • Reduce feed rate
Notch wear 	• Excessive feed rate and cutting depth	• Reduce cutting depth • Reduce feed rate • Increase coolant supply
Edge flaking 	• Excessive feed rate • Separation of BUE • Weak cutting edge	• Check edge geometry • Increase stability of the system • Use larger lead angle
Plastic deformation 	• Excessive feed rate and cutting speed	• Reduce cutting speed • Reduce feed rate • Reduce cutting depth
Built-up edge 	• High affinity with workpiece • Low cutting speed	• Increase cutting speed • Increase feed rate • Use larger rake angle
Breakage 	• Excessive feed rate and cutting depth	• Reduce feed rate • Reduce cutting depth • Increase stability of the system

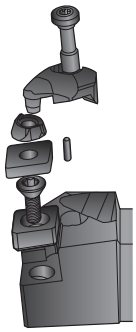
Toolholders, insert clamping principles

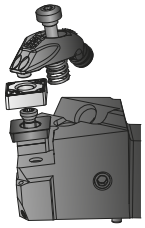
D Toolholder
First choice for general machining, external

– For negative basic shape inserts with hole



– Robust, stable locking arrangement

The insert is locked in position by means of a clamp which presses the insert into and down onto the fixed insert seat

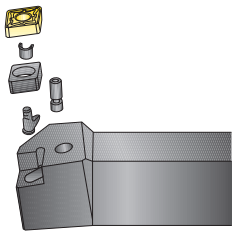


D.....-C Toolholder

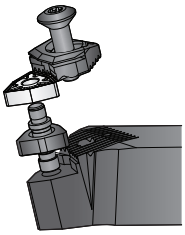
– With pin and carbide pressure plate

D.....-JETI Toolholder

– With coolant clamp for Jetstream Tooling



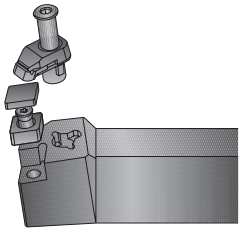
P Toolholder
A complement to the D Toolholder, external



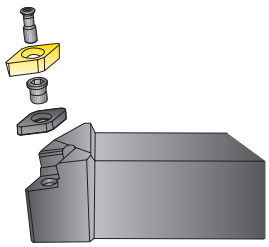
– For negative inserts with hole

– No clamp on the top, facilitates free chip flow

In the illustration when the clamping screw is tightened and the toggle lever secures the insert in the insert seat with a shim by a shim clip



In the alternative design the clamping screw acts upon the wedge that pushes the insert towards the centre pin according to the illustration to the right



C Toolholder
Designed mainly for Seco PCBN inserts without hole

The insert is locked in position by means of a clamp, which is equipped with a carbide plate

S Toolholder
For external and internal turning with positive inserts

The insert is locked in position by a centre screw

Jetstream Tooling® – Introduction

Seco Jetstream Tooling® is a revolutionary solution to the problem of delivering coolant precisely to the cutting zone. It works by delivering a concentrated high pressure jet of coolant at high velocity straight to the optimum position close to the cutting edge. The jet lifts the chips away from rake face, improving chip control and tool life enabling increased cutting data. It is proven to show improvement in nearly all material groups and with a wide choice of coolant pressures.

Seco Jetstream Tooling® consists of holders for external turning, both square shanks, Parting-off blades and Seco-Capto™ backends. For internal turning, Jetstream Tooling® capability is being integrated to JET GL-Turning heads for Steadyline® and some internal turning bars with the help of the unique coolant clamps. It can be mounted and used on a large selection of machines. For general ISO turning coolant can either be supplied to the toolholder internally in the case of JETI or Seco-Capto™ toolholders or externally through a coolant hose.

The JETI product platform is developed with a compact assembly in mind. The JETI toolholders with integrated coolant channels eliminates the need for any external piping and connections that would otherwise obstruct machine movements in tight workspaces. Integrated channels in adapter and toolholder make it possible for coolant to reach the cutting edge directly from the adapter.

Hoses for external connection which is attached to one of the inlet positions of the toolholder allow the coolant supply to be connected to almost any position on the turret or tool block.

Seco Jetstream Tooling® Duo toolholders, feature both a rake face and flank face jet, that may provide even better chip control and significantly longer tool life.

Products are available for ISO turning with positive and negative inserts, as well as for Grooving and Parting-off. Note that it is up to the turning professional to make sure that all aspects of health and security are fulfilled.

Insert carrier	Maximum recommended coolant pressure	
	bar	psi
Square shank with hose	275	4000
GL-Head with Steadyline® bar – Cylindrical	200	3000
GL-Head with Steadyline® bar – HSK	100	1500
GL-Head with Steadyline® bar – Seco-Capto™	150	2000
Seco-Capto™	150	2000
JETI toolholders and blades	200	3000
Adapters	**Maximum recommended coolant pressure**	
	bar	**psi**
JETI Adapter with Seco-Capto™	150	2000
JETI Adapter with VDI	80	1100 (2000)
JETI Adapter with HSK-T	100	1500
JETI Adapter with Square shank	275	4000

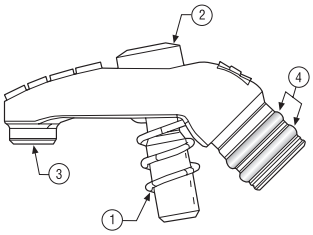
When using toolholder together with an adapter the maximum coolant pressure is limited to the adapter's maximum coolant pressure.

Designation of Jetstream Tooling® holders follows ISO, see page(s) 11-16, 17-18.
Jetstream Tooling® for Grooving and Parting-off, see page(s) 681, 933, 963.

Coolant clamps

The unique 3D printed coolant clamps

The coolant clamp executes many functions. It provides a secure and fast clamping of the insert by virtue of the spring loaded design with a single screw. It directs and orients the high pressure coolant jets straight and close to the cutting edge. The manufacturing flexibility of the coolant clamp allows it to have an optimised coolant channel with different hole diameters.



Selection includes standard, finishing and roughing coolant clamps with orientations neutral, right and left.

The horizontal orientation angles 0°, 10° and 20° are also available.

A major portion of the ordering code is laser marked on the coolant clamp.

The Jetstream Tooling coolant clamp is designed to have the coolant beam oriented as close as possible to the cutting point, this to get the best effect of the Jetstream coolant and to be able to break or redirect the chips. The APNOM value is a cutting depth indicator we recommend to stay below to get the intended performance.

Changing the insert

Simply loosen the spring loaded coolant clamp screw.

Change or index the insert. Ensure the coolant clamp pin and the double O-ring are well inside the fixing hole before tightening from the top.

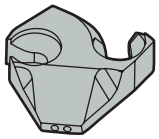
Tighten the screw with recommended torque.

1. Spring
2. Clamp screw
3. Clamp pin
4. O-rings

Changing O-rings and screw

It is recommended that O-rings are checked regularly since the double O-rings are the coolant entry-point of the coolant clamps. When the O-rings are exchanged it is recommended to also make it a habit to exchange the screw to ensure pro-active high pressure operational safety.

After changing the O-rings, ensure that both the Coolant clamp pin & the O-rings are in the correct angle to the fixing hole position before tightening the screws, otherwise it may cause damage to the O-rings.

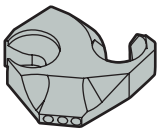


JET/ JETL inducer

Holders with this original Jetstream Tooling® innovation will step by step be discontinued however to support earlier investments the inducers will be available to the end of 2024.

Finishing inducer

The mounted Jetstream Tooling® Finishing Inducer gives a universally applicable coolant jet, which provides a well positioned coolant wedge from finishing to medium-roughing applications.

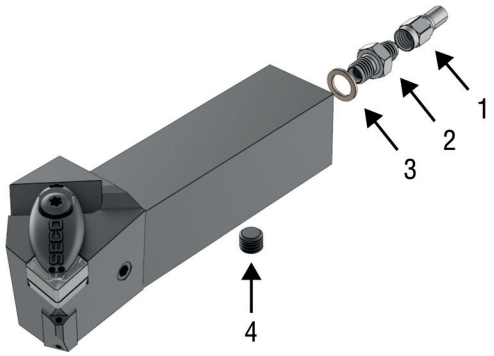


The inducers are marked with “-F” suffix.

Roughing inducer

As accessories there are Jetstream Tooling® Roughing Inducers available for easy exchange providing a more boosted coolant wedge for clearer roughing applications or for cases demanding more space for the chip flow.

The inducers are marked with “-R” suffix.

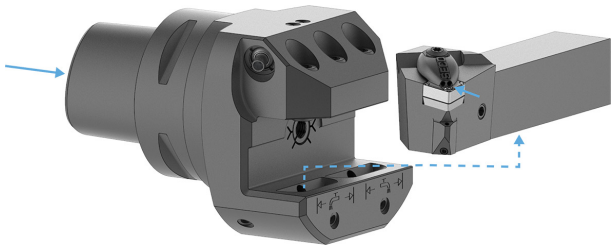


Changing the insert

Simply loosen both locking screws, and rotate the inducer clear of the insert. Check the condition of the tool, screws and O-ring and exchange regularly. Change or index the insert in the standard way before rotating the inducer back into position (make sure the inducer O-ring is still in place) and re-tighten the insert locking screw before locking the inducer.

Jetstream Tooling® Assembly instructions

JETI Assembly instructions with hoses



For personal safety, Jetstream Tooling® should only be used with the machine door in a fully closed position in accordance with general machine safety procedures. Please ensure that the coolant hose is located correctly and fully tightened with all seals in position. The unused coolant hose should have a blanking plug fitted.

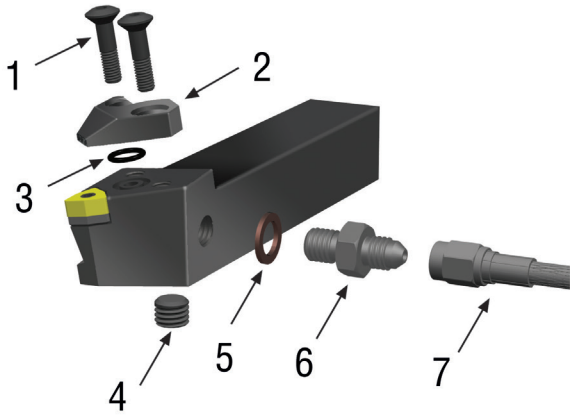
For accessories, see page(s) 1026.

1. Coolant hose
2. 1/8" BSP Adapter
3. Copper washer
4. Plug

JETI Assembly instructions with adapter

To use the benefits of a JETI-holder there is a need to use toolholder adapter designed for JETI-connections. Maximum coolant pressure when using this feature is limited to the adapter's maximum coolant pressure.

Note: The unused coolant hole (from the back) should have a blanking plug fitted.



Jetstream Tooling® Assembly instructions

JET/ JETL Assembly instructions

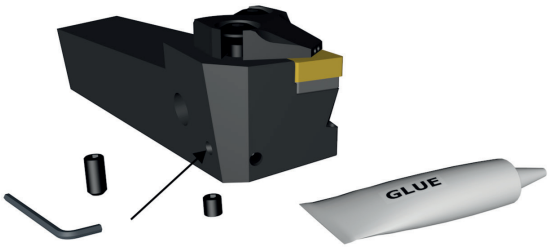
Holders with this original Jetstream Tooling® innovation will step by step be discontinued however to support earlier investments the inducers will be available to the end of 2024.

For personal safety, Jetstream Tooling® should only be used with the machine door in a fully closed position in accordance with general machine safety procedures. Please ensure that the coolant hose is located correctly and fully tightened with all seals in position. The unused coolant hole should have a blanking plug fitted. Please note the maximum safe working pressures shown below.

The recommended torque for tightening the inducer locking screw 117.26-655 is 4 Nm, see page(s) 1028.

1. Locking screws (can be ordered separately)
2. Coolant inducer
3. Inducer 'O' ring
4. Blanking plug*
5. Copper washer
6. 1/8" BSP Adapter
7. Coolant hose

* Make sure the blanking plug is securely in position in the unused coolant hole prior to use.



Maximum working pressures

Seco-Capto™ – 70 bar (1000 psi)

Square shank – 275 bar (4000 psi)

In the rare cases you need to shut off the Duo outlet underneath the insert, first remove the short screw in the side of the toolholder.

Then mount the long plugging screw P6SS4X8 (02885815) using suitable glue to seal the thread (e.g. Loctite® 270). Plugging the underneath outlet should be considered permanent and irreversible.

Replace the short screw here with the long screw to shut off underneath coolant

Seco-Capto™ – Introduction

Seco-Capto™ is a quick-change modular tooling system for quick set-up and replacement of the cutting edge.

Advantages

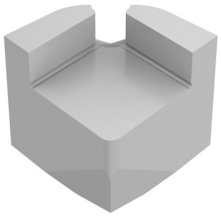
– Quick tool change, increases the available productive time.

– Flexible, same toolholder can be used in different machines which reduces the tool stock.

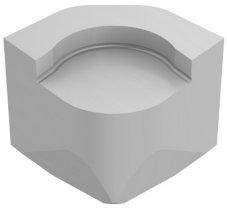
– Modular, building of tools with extension adapters reduces the tool stock.

– Rigid, no reduction of cutting data.

– Accurate, tapered polygon coupling produces a strong, self centering joint with repeatability within ±0,002 mm / *0.000078 inch*.



All toolholders have through holes for coolant.



Seco-Capto™, Cassette holders for Advanced material

The replaceable cassette for PCBN and Ceramic inserts are made out of a special stainless steel with high hardness and high strength. This avoids damage to the pocket which is an otherwise normal occurrence in heavy roughing applications and will also protect the brittle insert.

The centering accuracy and repeatability of the cassette holder are as good as std Seco-Capto™ holders.

Advantages

– Flexibility and versatility by using different cassettes/ insert types in the same Capto unit will significantly reduce stock volume and net working capital.

– Cost savings as only pockets will need to be exchanged instead of entire holdes when insert pocket damages occur.

– Exceptional process reliability in applications with high risk of extensive tool wear.

Recommended tightening torques for the cassette and clamp

6 Nm

To apply the recommended tightening torque, we recommend to use torque spanners, available as accessories, see MN Tooling Systems catalogue.

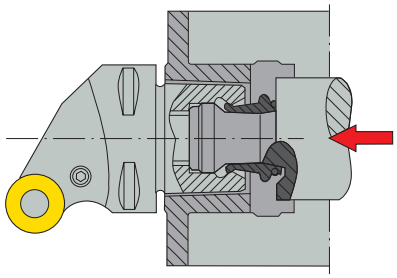
Clamping units

The manual clamping units are available in different versions;

– VDI shaft, straight or angled.

– Shank type to use with external toolholders.

– Cylindrical type to use with internal toolholders.

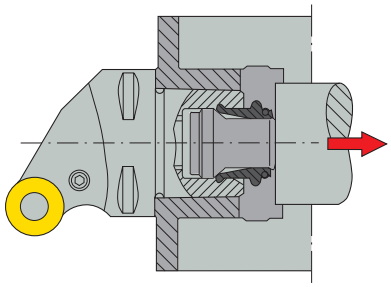


– Versions for special applications.

The unit is locked with a drawbar or screw from the back

Clamping units, please see page(s) 1010-1020.

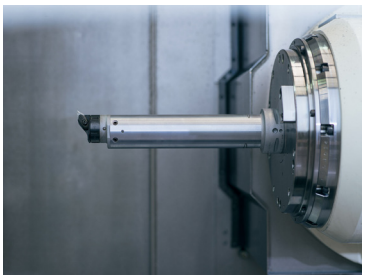
Unclamped position



When the drawbar is pushed forward the diameter of the clamping segments decreases and the clamping segments are loosened from the cutting unit. The drawbar also pushes the cutting unit out from the joint.

Clamping segments

Clamped position



When the drawbar is pulled back, the diameter of the clamping segments expand and the cutting unit is pulled into position.

Clamping segments

Steadyline® vibration damping holders for turning and boring operations

Steadyline® for tool overhang challenges

Seco`s patented Steadyline® vibration damping holders may drastically improve the productivity of a turning assembly in application.

It allows the use of much higher cutting data, with quieter operation and optimum stability with the flexibility to optionally use same bars for turning and holemaking applications.

These boring bars are available in a range of:

– Body diameters

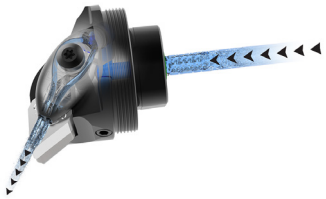
– Lengths

– Seco-Capto™, HSK-T/A and Cylindrical shank connections both in Metric & Inch Sizes.

– Exchangable GL-Heads for all diameters with intermediate BA-connection in some diameters

(The ranges are also indicated in the below Steadyline summary illustration see page 93)

The Picture to the right shows a Steadyline bar together with Jet GL-Turning head as mounted in machine.



Benefits from increased productivity of unique GL-Turning Heads

Every aspect of Steadyline® holders has been designed with the consideration for increasing productivity, capacity and machining economy in tool overhang challenges. The design features of the patented unique GL-Turning heads preserve & enhance the Steadyline bars to perform & deliver maximum benefits. Every GL-head has precisely ground, taper quadrilobe based connection which can be accurately centered & grabbed firm to the Steadyline® bar using the fine pitch threaded clamping nut delivering:

– The centering accuracy and repeatability of the GL-Heads as good as Seco-Capto™ quick-change system.

– Designed for 0°/180° turning head orientation.

– Optimum damping strength through short and compact GL-Heads for Steadyline bars.

Advantages are:

– Efficient: Ensures a quick and firm connection and thus decreases the head changing time drastically and increases productivity.

– Flexible: The quadrilobe enables 180 degree orientation of the turning head and hence can be used as left & right hand tools depending on the machining system.

– Accurate: The taper quadrilobe coupling produces a strong self-centering connection with repeatability within ±0,002 mm at identical conditions.

– Modular: Building different types and styles of Steadyline® bars with suitable GL-Turning heads reduces the inventory.

– Enhances the damping function: The compact and short GL-turning heads are close to the Steadyline® damping mass.

– Jetstream Tooling® gives higher tool life, especially for superalloys and enhances chipbreaking.

– Operational safety: The coolant seal at the backend and the double O-rings of the coolant clamp ensures maximum operational safety up to 200 bars.

The Jet GL-Turning heads further strengthen the solution by integrating the Jetstream Tooling® benefits to the GL-Turning head and in turn to the Steadyline® bar. JET GL-Turning

heads use a multifunction coolant clamp for the successful outcome by

-Increasing productivity by increased parameters, surface finish, tool life and vibration free machining

– Reduce head changing down times & insert indexing down times thanks to the unique GL-Heads

– Achieving highly accurate parts with secured surface finish

– Increasing selection & less critical spares for maximized versatility

– Increasing flexibility by using same bars for turning and boring & same heads for 0°/180° turning head orientation

– Controlling wear, heat & chips with Jetstream Tooling®

– Increasing operational safety at high pressures

GL -Turning head range offer most applicable designs for internal turning.

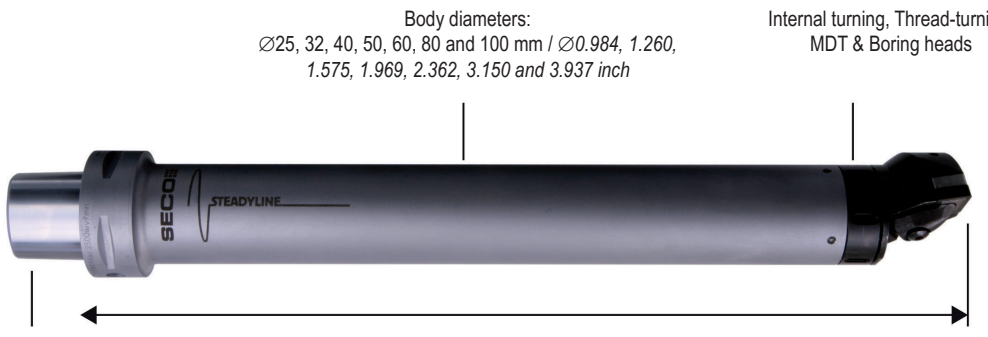
– Jetstream tooling integrated “Jet GL heads” ∅32, ∅40 and ∅50.

– Standard GL Heads for ∅25, ∅32, ∅40 and ∅50.

– Jetstream tooling integrated GL- Grooving/Parting off heads ∅25, ∅32, ∅40 and ∅50.

– Jetstream tooling integrated GL- Threading heads ∅25, ∅32, ∅40 and ∅50.

Note: GL25-turning heads don´t offer Jetstream tooling integrated to reduce the deflections to the minimum.



Detailed operating instructions are part of bars delivery content.

For details of GL-Turning Heads for Turning, and MDT, see page(s) 643-679.

For details of GL-Boring heads, see MN Holemaking catalogue.

Note: The Jet GL-Turning heads use a coolant clamp. See Coolant clamp page for more details regarding this in page(s) 86.

Steadyline turning product range summary

Product range and design

Steadyline body diameter	Machine side connections	Working length	BA Connection	GL-Heads	Jetstream Integration	GL-Head styles LH & RH	Inserts

∅100	∅100, ∅101.6 (4”)	10xBD (Steel)	BA100				

Note: ∅ 25 Steadyline 10XBD bars have carbide re-in forced shank design for maximum stability.

Recommended tightening torques for GL connections

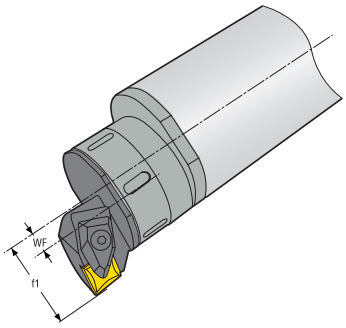
For GL workpiece side size	Recommended tightening torque
GL25	25 Nm / *221 In/Lbs.*
GL32	25 Nm / *221 In/Lbs.*
GL40	35 Nm / *310 In/Lbs.*
GL50	55 Nm / *487 In/Lbs.*

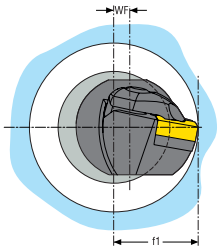
To apply the recommended tightening torque, we recommend to use torque spanners, available as Accessories, see MN Tooling systems catalogue.

BA-connection adaptor for GL-heads

BA-Connection allows making use of a wide range of GL50-Heads for Steadyline® bars ∅60, ∅80, ∅100 mm / *2.362, 3.150, 3.937 inch*.

Each BA-Connection is available in 2 radial offset sizes 'WF' to achieve 2 'f1' reaches, for flexibility over minimum bore diameter & chip space.





First choice: Wide offset WF providing a wider space.

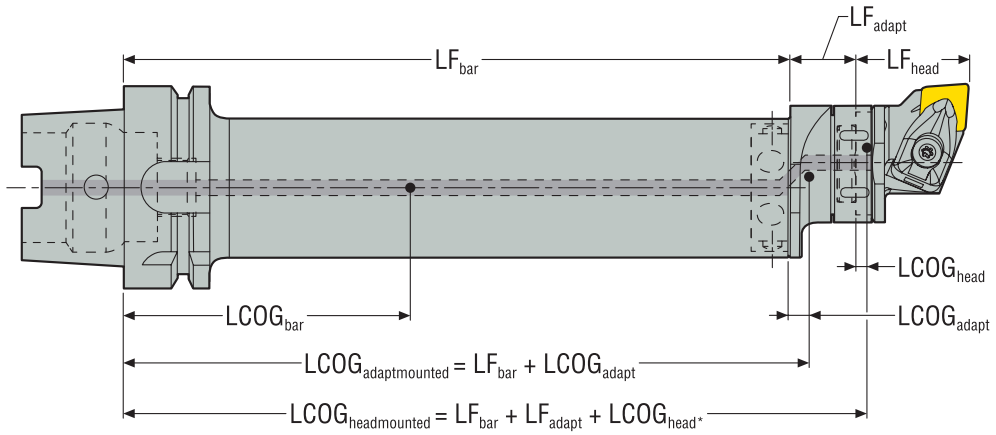
Additional option: Mini offset WF when accessibility is limited.

Steadyline® BA-Connection with Seco-Capto™ and HSK-T/A machine side connections can also be used for rotating boring operations, when fitted.

For detailed information about BA to GL adapters, see page(s) 637-638.

Recommended tightening torques for BA connection screws

For BA workpiece side size	Kit of 4 locking screws	Recommended tightening torque
BA060	90FQ4	11 Nm / *97 In/Lbs.*
BA080	90FQ52	16 Nm / *142 In/Lbs.*
BA100	90FQ6	23 Nm / *204 In/Lbs.*



We recommend to use HC torque spanners, commonly available on the market.

Steadyline® bars clamping & in tool changers

The maximum swinging torque (T) of heavy, long assemblies must be taken into consideration when an automatic tool changers is used to move the bar in the machine.

As a first rough estimate comparing the needed swinging torque of a Steadyline® bar with a specific machine's automatic tool change torque limit, $T_{swinglimit}$, the following simplified formula can be used using only data from the Steadyline® bar in mind.

$$T_{simple} = g \times [\mathbf{LCOG}_{bar} * \mathbf{m}_{bar}] * 1.25 / 1000 \text{ Nm} < T_{swinglimit}$$

However, it is recommended to consider the swinging torque for the whole assembly by using the following formula.

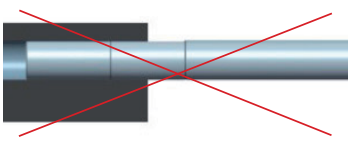
$$T = \frac{g \times (\mathbf{LCOG}_{bar} * \mathbf{m}_{bar} + \mathbf{LCOG}_{adaptmounted} * \mathbf{m}_{adapt} + \mathbf{LCOG}_{headmounted} * \mathbf{m}_{head})}{1000}$$

T = Maximum swinging torque of the assembly in Nm
m = mass in kg
LF = functional lengths in mm
LCOG = Positions of the center of gravity in mm

Notes:
a) During tool change, the tool acceleration generates an additional force. It is strongly recommended to slow down the tool changing process if the tool weight or torque is close to the machine limits or to change the tool manually.
b) LCOG, LF and mass values are available in Product pages. If $LCOG_{adapt}$ / $LCOG_{head}$ is unknown, a good estimation can be obtained by replacing LCOG by respective ½ LF.

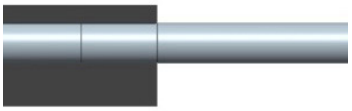
Machine clamping recommendations

Seco's first recommendation for clamping the bars onto the machines is to use bars with Seco-Capto™ machine side connections.



Second choice is the bars with HSK-T/A machine side connections, as both these solutions provide several benefits:

– Maximum stability thanks to the taper-face system and higher bending resistance



– High positioning accuracy of cutting edge, etc.

While using the third choice, the cylindrical bars, Seco strongly recommend to clamp on the marked cylindrical clamping area ensuring the full 4xD clamping lengths using split sleeves / boring holders.

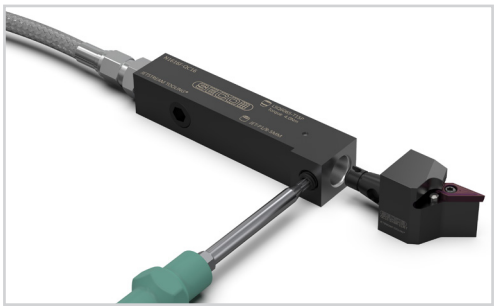
4x∅

QC Modular Toolholder Introduction

QC Modular Toolholders provide small part machining companies access to benefits seen as given for larger lathes such as:



– Flexible and reduced down-time by fast QC modular head exchange.

– Precise QC modular interface allow for high repeatability

– Jetstream Tooling precise coolant delivery for improved chip control and long predictable tool life

– Multiple heads fit in same shank for greater versatility

Experience these proven solutions for all sliding head machines and see the recommended connections directly under spare parts of the shanks at www.secotools.com.

QC Shank adapter to JET-HOSE

Shank 1616 needs only a JET-Hose kit to be connected, all other sizes need also the JET-ADM8-1.0 adapter.

QC Shank adapter to JET-HOSE		QC Shanks
10001981	JET-ADM8-1.0	N03..., N05..., N10..., N12...

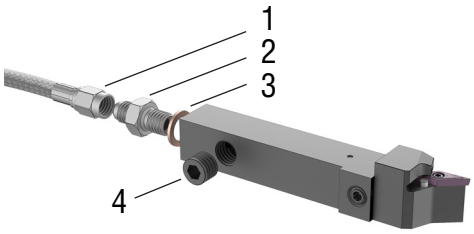
QC Modular Assembly instructions

QC Modular Toolholder assembly instructions

Assembly the QC toolholder with one screw only, for precise and safe assembly between the head and shank we recommend using a torque of 4.0 Nm (Torque key T00-15P40), for all torque keys available see page(s) 1029.

1. Torque 4.0 Nm

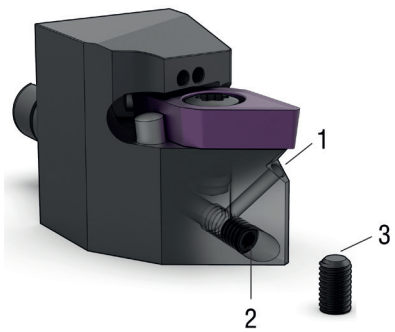


High Accuracy connection
– Twisting tolerance ± 5 µm (0.0002 inch)
– Repeatability tolerance ± 3 µm (0.0001 inch)

Jetstream Tooling® – Assembly instruction for hoses

For personal safety, Jetstream Tooling® should only be used with the machine door in a fully closed position in accordance with general machine safety procedures. Please ensure that the coolant hose is located correctly and fully tightened with all seals in position. The unused coolant hose should have a blanking plug fitted.

Hoses can be assembled from both the side as well as in the back of the shank. The thread to be use for hose connection various between different sizes, for 1616 shank the 1/8BSP thread are used and for the smaller shank sizes M8*1.0 thread.



For accessories, see page(s) 1026.

1. Coolant hose
2. Hose adapter
3. Copper washer
4. Plug screw

Jetstream Tooling®Duo

Jetstream Tooling® Duo, available on a selection of cutting heads, adds a second coolant outlet from the clearance side. The second coolant outlet can be shut off if needed for specific applications for even more versatile machining or limitation in coolant supply. To shut off Duo coolant outlet, remove P6SS3X3G and change to the longer screw P6SS3X5 available as accessories. Important to also use suitable glue to seal the thread (e.g.Loctite® 270).

1. Duo Coolant
2. P6SS3X3G
3. P6SS3X5

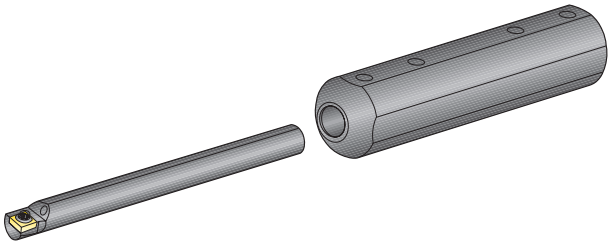
Small diameter boring – Introduction

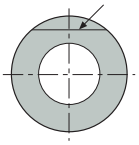
Seco offers a range of small diameter boring bars to machine holes as small as 5,5 mm / *0.216"*. Inserts are available in C and T shape.

The toolholders are available in steel and have the possibility for internal through coolant.



Set-up information

When positioned in the machine the insert will sit slightly above centre line. This is a design feature of the tool that compensates for the deflection and improves the machining operation.

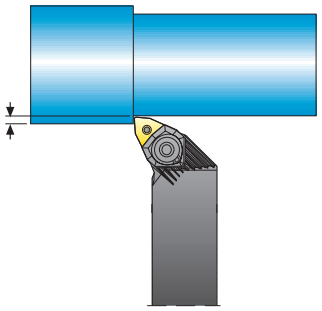


When setting the tool in the machine be sure to position it with the flat parallel and in the same plane as the bed of the machine.

The boring bars can be used with or without the cylindrical toolholder sleeve.

Please see page(s) 1009.

Position flat parallel with machine bed



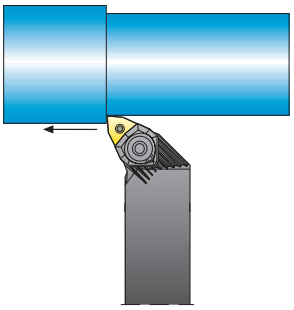
Cutting data, general

There are several opportunities to adjust and explore cutting data adjustments in www.secotools.com under the Cutting Data section especially when logging in since this unlock option not available as “Guest” For example explore cutting data directly by reading the QR-code.

Depth of cut

The maximum depth of cut that can be used depends on a number of factors. Machine power, stability, workpiece material, insert shape and size, nose radius, chipbreaker, grade and cutting edge angle.
Start with the insert size to get an indication and proceed with the recommendations for the chosen chipbreaker. This will give a suitable maximum depth of cut.

A rule of thumb could be that the minimum depth of cut should not be smaller than the nose radius.



Feed rate

The maximum feed rate that can be used depends on a number of factors. Machine power, stability, workpiece material, insert shape and size, nose radius, chipbreaker, grade and cutting edge angle.
Another, very important factor is the required surface finish. Start by looking at the recommendations for the chosen chipbreaker. Then look in the surface finish table below to be sure that the required surface finish can be achieved.

The maximum feed rate should preferably be considerably smaller than the nose radius.

A too low feed rate can result in poor chipbreaking and tool life.

Surface finish

A large nose radius normally produces a better surface finish.
The table gives recommended maximum, theoretical, feed rates to achieve a specified R_a-value.
Always consider the possibility to use high feed inserts (Seco Wiper), for turning with high feed with retained surface finish.
For more information, see page(s) 62, 117-119, 130-131.

Note: The refined estimate R_a equation is based on work by J-E Ståhl and gives better surface estimates often indicating potential to increase feeds compared to other estimates.

Cutting data – Nomenclature and formulae

RPM	$n = \frac{v_c \cdot 1000}{\pi \cdot D_c}$	(rev/min)
Cutting speed	$v_c = \frac{n \cdot \pi \cdot D_c}{1000}$	(m/min)
Surface finish (arithmetic average deviation) Rough estimates	$R_a = \frac{f^2 \cdot 50}{RE}$	(µm)
	$R_a = \frac{R_t}{3,5}$	(µm)
Refined estimate	$R_a \approx 770 \cdot \left(1 - \frac{\frac{f}{2RE}}{\arcsin\left(\frac{f}{2RE}\right)}\right) \cdot RE(\mu m)$ Valid for: $f \leq 2\sqrt{a_p(2RE - a_p)} \leq 2RE$ see note and table in page(s) 102	
Surface finish total height of profile estimate	$R_t = k \cdot \frac{f^2 \cdot 1000}{8 \cdot RE}$	(µm)
Power demand estimate	$P_c = \frac{v_c \cdot f \cdot a_p}{25}$	(kW)
Metal removal rate	$Q = v_c \cdot f \cdot a_p$	(cm³/min)

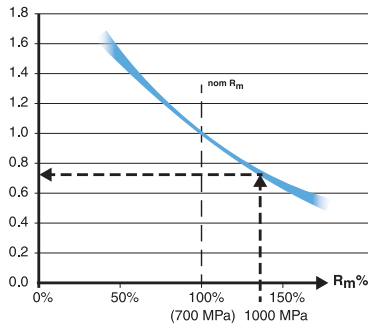
a_p	=	Depth of cut	(mm)
DC	=	Workpiece diameter	(mm)
f	=	Feed rate	(mm/rev)
h	=	Chip thickness	(mm)
k	=	Constant 1,0 for steel and strainless steel 1,4 for cast iron	
n	=	RPM	(rev/min)
P_c	=	Power demand	(kW)
Q	=	Metal removal rate	(cm³/min)
R_a	=	Surface finish (arithmetic average deviation)	(µm)
RE	=	Nose radius	(mm)
R_t	=	Total height of profile surface	(µm)
v_c	=	Cutting speed	(m/min)

Cutting data, workpiece materials

In SMG classification of workpiece materials involves a specific material standard in a specific condition assigned as reference for easy and unabiguous adjustment of cutting data for any actual material compared to any Seco reference material. As examples the reference materials EN C45E for SMG P4 and EN 42 CrMo 4 for both SMG P5 and SMG H5 shown below in table 1 where the reference level material property is indicated. (A more complete extract can be found on SMG section starting page 1030.

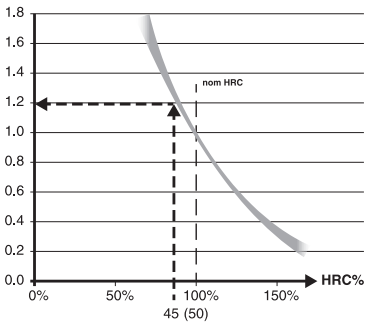
SMG	Description	Properties	Reference
P4	Low-alloy general structural steels, 0.25% < C < 0.67%wt Low-alloy Quench & Temper steels	520 < R_m < 1200	C 45E R_m = 660 N/mm²
P5	Structural steels, 0.25% < C < 0.67%wt Quench & Temper steels	550 < R_m < 1200	42 CrMo 4 R_m = 700 N/mm²

SMG	Description	Properties	Reference
H5	Quenched & Tempered steels	38 < HRC < 56	42 CrMo 4 50 HRC



Focusing specifically on EN 42 CrMo 4 in annealed condition, the ultimate tensile strength R_m may typically vary between Rm = 630 N/mm² and R_m = 780 N/mm², which provide a reference level for SMG P5. In Quenched & Tempered condition, the ultimate tensile strength R_m may typically be between R_m = 900 N/mm² and R_m = 1100 N/mm² thus still belongs to SMG P5. However, if hardened above R_m = 1200 N/mm² it instead belongs to SMG H5.

SMG	EN	W.-Nr	AFNOR	BS	UNI	JIS	AISI / ASTM	GOST	Condition	R_{m_nom}	HRC_{nom}
P5	42 CrMo 4	1.1201	42 CD 4	708 M 40	42 CrMo 4	SCM 440 (H)	4142, 4140	38HM	Annealed	700	
	42 CrMo 4	1.1201	42 CD 4	708 M 40	42 CrMo 4	SCM 440 (H)	4142, 4140	38HM	Quenched & Tempered	1000	
H5	42 CrMo 4	1.1201	42 CD 4	708 M 40	42 CrMo 4	SCM 440 (H)	4142, 4140	38HM	Quenched & Tempered		45
	42 CrMo 4	1.1201	42 CD 4	708 M 40	42 CrMo 4	SCM 440 (H)	4142, 4140	38HM	Quenched & Tempered		50



The EN 42CrMo4 quench & tempered steel could be used to illustrate the machinability dependence of materials' condition.

The graphs below indicate how speed recommendations for a nominal material conditions may be adjusted for relative R_m (left diagram valid for ISO-P) and for relative HRC (valid for ISO-H).

Speed recommendation based in material machining properties, steel

Speed recommendation based in material machining properties, hardened steel

To further illustrate how the SMG P5 nominal v_c can be adjusted to a more accurate recommended v_c we need ultimate tensile strength R_m data and in this case we use the EN 42 CrMo 4 quenched & tempered to R_m = 1000 N/mm² according to above table (bold blue arrows).

Assume that we find that the SMG P5 nominal v_c = 280 m/min / *918.64 sfm* for a certain product and machining.

Then, actual recommended v_c = 280 m/min x 0,75 = 210 m/min / v_c = *918.64 sfm x 0.75 = 688.98 sfm.*

Consequently in the SMG H5 the nominal v_c can be adjusted using the hardened EN 42 CrMo 4 at HRC 45 (smaller grey arrows).

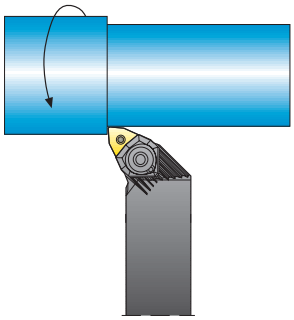
Assume that the SMG H5 nominal v_c = 50 m/min / *164.04 sfm* for a certain product and machining using a coated cemented carbide tools then, actual recommended v_c = 50 m/min x 1,2 = 60 m/min.

Note that when using PCBN tools cutting data recommendation starts at page(s) 140.

For further workpiece material details please see page(s) 1030 and suggested cutting data at applicable pages.

For more convenient cutting data handling we recommend applicable tools in My Pages – on www.secotools.com

These cutting data compensations for steels are fully implemented at www.secotools.com in MyPages (see QR-code in the upper right corner).



Cutting data

Cutting speed v_c (m/min)

In this section a recommended cutting speed is indicated under specified conditions and a selected SMG.

Use the tables beginning on page(s) 1030 to classify the workpiece material into a SMG.

In order to increase the accuracy towards the actual cutting conditions and requirements of the applications the recommendation is to use Seco MyPages, Suggest or explore www.secotools.com (see QR-code in the upper right corner).

KAPR = cutting edge angle (°) (from holder)

RE = nose radius (mm / *inch*)

a_p = depth of cut (mm / *inch*)

f = feed rate (mm/rev / *inch/rev*)

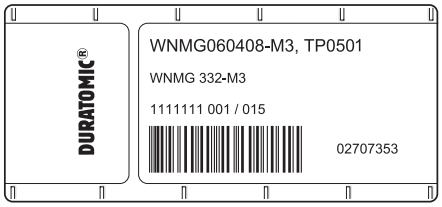
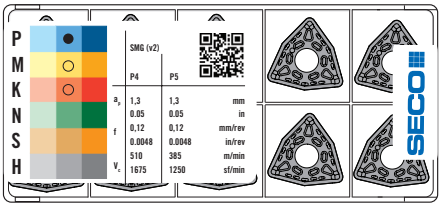
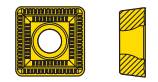
Insert label and packaging

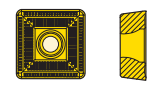


Inserts have to correspond to insert seat pocket on a toolholder and on the back of a insert box the insert code is written in accordance to ISO and ANSI standard. To simplify storage these codes also are added to one short side of the box.

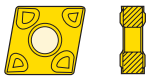


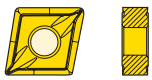
The back also holds information of the unique batch number and product number also available as bar code see to the right.

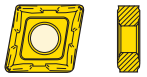


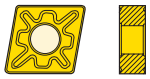


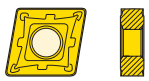
On on the front side of a general turning insert box the secolor code is present to the left (see page 32 for more clarity) and a first very general cutting data recommendation presented for two different workpiece materials categories according to the SMG classification in both metric and inch system.

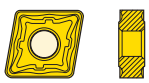




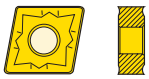


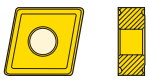


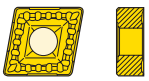


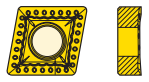


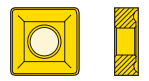
Note that the QR-code in the corner provides a direct link to the present product cutting data page to allow more precise cutting data recommendations based on the specific adjustments to actual application done at www.secotools.com webpage.

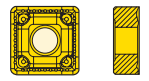




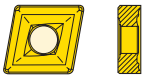


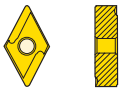




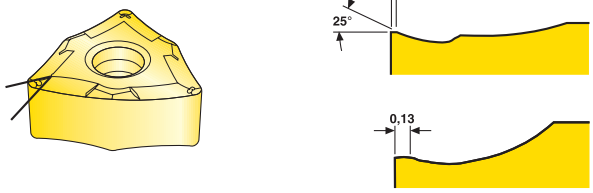


If you don't have access to a computer download the Seco Assistant application, available in the Google Playstore or Apple App-store. Then you can scan the barcode or QR-code and get instant access to product-information and many more functions.



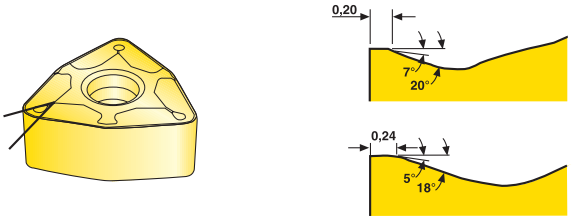


Chipbreaker program, positive basic shape inserts			
-AL			Chipbreaker for positive inserts. Intended for machining of aluminium alloys. The highly polished rake face and the very large rake angle ensure extremely light cutting action. Recommended machining range: f = 0,15–0,60 mm/rev, a_p = 0,5–4,0 mm. *(f = 0,006–0,024 in/rev, a_p = 0,020–0,160 in).*
-FF1			Chipbreaker for positive inserts. Used to achieve a very fine finish when turning slender steel and stainless steel components. Recommended machining range: f = 0,05-0,30 mm/rev, a_p = 0,2-2,0 mm. *(f = 0.002-0.012 in/rev, a_p = 0.008-0.080 inch.).*
-F1			Chipbreaker for positive inserts. Positive geometry with sharp cutting edge gives easy-cutting properties. Suitable for high feed rates at fine depths of cut in precision forgings and castings. Recommended machining range: f = 0,1-0,5 mm/rev, a_p = 0,2-3,0 mm. *(f = 0.004-0.020 in/rev, a_p = 0.008-0.120 in).* Machining in bar automatics, for instance: f = 0,08-0,25 mm/rev, a_p = 1-3 mm. *(f = 0.003-0.010 in/rev, a_p = 0.040-0.120 inch).*
-MF2			A versatile finishing to semi-finishing chipbreaker with light-cutting action for positive inserts. Suitable for a wide range of cuts in steel and stainless steel finishing applications including boring. Recommended machining range: f = 0,08–0,50 mm/rev, a_p = 0,15–3,00 mm. *(f = 0.003–0.020 in/rev, a_p = 0.006–0.120 inch).*
-M3			A reliable semi-finishing to medium roughing chipbreaker ensuring safe chip flow. Suitable for medium cuts in steel and stainless steels application including boring. Recommended machining range: f = 0,12–0,60 mm/rev, a_p = 0,2–4,0 mm. *(f = 0.005–0.024 in/rev, a_p = 0.008–0.160 inch).*
-M5			A highly reliable chipbreaker for positive inserts. Intended for medium-rough and rough machining of steels, stainless steels and cast iron. Combines high edge strength with comparatively low cutting forces. Safe action in interruptions and rough skin on parts also including boring. Recommended machining range: f = 0,15–0,60 mm/rev, a_p = 1–5 mm. *(f = 0.006–0.024 in/rev, a_p = 0.040–0.200 inch).*
-R3			Chipbreaker for large round inserts are for finishing and medium machining of difficult to machine materials from steel to superalloys also in large components such as railway wheels for enhanced difficult machine materials for enhanced chipbreaking and surface finish. Recommended machining range: f = 0,5–1,2 mm/rev, a_p = 1,5–5,0 mm. *(f = 0.020–0.047 in/rev, a_p = 0.060–0.200 inch).*
-RR93			Chipbreaker for large round inserts are for medium machining and roughing of railway wheels, large components. Recommended machining range: f = 0,6-1,5 mm/rev, a_p = 3,0-10,0 mm *(f = 0.024–0.060 in/rev, a_p = 0.120–0.400 inch).*
-RR94			Chipbreaker for large inserts intended for roughing of railway wheels. Recommended machining range: f = 0,6–1,5 mm/rev, a_p = 3,0–10,0 mm. *(f = 0.024–0.060 in/rev, a_p = 0.120–0.400 inch).*
-RR96			Chipbreaker for large inserts intended for machining of steel with high depth of cut and large feed rates. Recommended machining range: f = 0,6–2,2 mm/rev, a_p = 3,0–24,0 mm. *(f = 0.024–0.085 in/rev, a_p = 0.120–0.945 inch).*
-RR97			Chipbreaker for large inserts intended for machining of steel with high depth of cut and large feed rates. The –RR97 geometry is stronger than the –RR96. Recommended machining range: f = 0,8–2,2 mm/rev, a_p = 3,0–24,0 mm. *(f = 0.032–0.085 in/rev, a_p = 0.120–0.945 inch).*
-UX			Chipbreaker for positive inserts. Smooth and easy chip flow on finishing and medium roughing in steel and stainless steel. Well suited for slim components. Recommended machining range: f = 0,05–0,40 mm/rev, a_p = 0,5-4,0 mm. *(f = 0.002–0.016 in/rev, a_p =0.020-0.160 inch).*



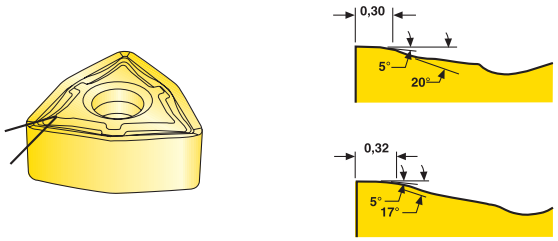
Chipbreaker program, negative basic shape inserts			
-FF1	FF1		Chipbreaker for negative inserts. Used to achieve a very fine finish when turning slender steel and stainless steel components. Recommended machining range: f = 0,08-0,30 mm/rev, a_p = 0,2-3,0 mm. *(f = 0.003-0.012 in/rev, a_p = 0.008-0.120 inch)*
-FF2	FF2		Chipbreaker for negative inserts. Intended for fine-finishing and semi-finishing of steels and stainless steels. The positive, tight chip groove offers light cutting action combined with superior chip forming. Recommended machining range: f = 0,08–0,30 mm/rev, a_p = 0,2–1,5 mm. *(f = 0.003–0.012 in/rev, a_p = 0.008–0.060 inch).*
-MF1	MF1		Chipbreaker intended for machining stainless steel, superalloys and titanium alloys. Type ..GG insert has a sharp, precision ground edge. Type ..MG insert has a lightly honed cutting edge for increased strength. MF1 is intended for use in semi-finishing and finishing applications. Recommended machining range: f = 0,08–0,30 mm/rev, a_p = 0,2–3,5 mm. *(f = 0.003–0.012 inch/rev, a_p = 0.008–0.140 inch).*
-MF2	MF2		First choice for finishing with negative inserts. Suitable for chip control at depths of cut down to 0,25 mm, provided that the feed rate is in excess of 0,25 mm/rev. Good capacity for medium rough machining. Recommended machining range: f = 0,10–0,40 mm/rev, a_p = 0,2–3,0 mm. *(f = 0.004–0.016 in/rev, a_p = 0.008–0.120 inch).*
-MF3	MF3		Chipbreaker with positive cutting rake angle intended for moderately difficult stainless steel. The MF3 is also intended for light roughing in relatively soft, "tacky" steel and difficult to machine stainless steel if the depth of cut is limited. MF3 can also be used for finishing of cast iron. Recommended machining range: f = 0,2–0,4 mm/rev, a_p = 1–4 mm. *(0.008–0.016 in/rev, a_p = 0.040–0.160 inch).*
-MF4	MF4		Chipbreaker intended for medium/finishing of stainless steel, very open and highly positive geometry. Recommended machining range: f = 0,15–0,50 mm/rev, a_p = 0,5–4,0 mm. *(f = 0.006–0.020 in/rev, a_p = 0.020–0.160 inch).*
-MF5	MF5		Chipbreaker intended for medium finishing of steel and stainless steel at high feeds. Very easy cutting and open geometry. Recommended machining range: f = 0,2–0,8 mm/rev, a_p = 0,2–2,7 mm. *(f = 0.008–0.032 in/rev, a_p = 0.008–0.100 inch).*
-M1	M1		Chipbreaker intended for superalloys and titanium alloys. It has a positive cutting rake angle which is slightly honed to increase the edge strength. Also available with a perfectly sharp edge (type ..GG insert). The M1 is intended for light roughing and for semi-finishing. Recommended machining range: f = 0,2–0,4 mm/rev, a_p = 1,5–5,0 mm. *(f = 0.008–0.016 in/rev, a_p = 0.060–0.200 inch).*
-M3	M3		First choice for medium-rough machining and also the most versatile Seco chipbreaker. In most cases, it is the only chipbreaker needed. Offers the best useful life and best chipbreaking in a wide range of cutting data and workpiece materials. Suitable for precision forged and cast workpieces (NNS or Near Net Shape workpieces) as regards both chip control and edge strength. Recommended machining range: f = 0,15-0,50 mm/rev, a_p = 0,5-5,0 mm. *(f = 0.006-0.020 in/rev, a_p = 0.020-0.200 inch).*
-M4	M4		Chipbreaker intended for cast iron. Positive rake angle with a narrow T-land gives low cutting forces. First choice for cast iron machining at high speeds. Recommended machining range: f = 0,1-0,7 mm/rev, a_p = 0,2-5,0 mm. *(f = 0.004-0.028 in/rev, a_p = 0.008-0.200 inch).*
-M5	M5		The choice for roughing by means of double-sided inserts. Intended for demanding operations at high feed rates in steel, stainless steel and cast iron. Combines high edge strength with comparatively low cutting forces. Recommended machining range: f = 0,3-0,7 mm/rev,a_p = 1,5-7,0 mm. *(f = 0.012-0.028 in/rev,a_p = 0.060-0.280 inch).*
-M6	M6		Strong double-sided chipbreaker, intended for semi-roughing and roughing of steel. A well-balanced design combining excellent chip control and relatively low cutting forces which provides reliable cutting action in both continuous as well as interrupted cuts. Well suited also for machining of ferritic and martensitic stainless steels. Recommended machining range: f = 0,2-0,8 mm/rev, a_p = 1,0-7,0 mm. *(f = 0.008-0.031 in/rev, a_p = 0.040-0.275 inch).*

Chipbreaker program, negative basic shape inserts			
-MR3	MR3		Chipbreaker with a positive cutting rake angle that reduces cutting forces and gives a very high edge strength. Intended for medium-rough and rough machining of superalloys, titanium alloys and stainless and hardened steel. Recommended machining range: f = 0,2–0,6 mm/rev, a_p = 1,5–7,0 mm. *(f = 0.008–0.024 in/rev, a_p = 0.060–0.280 inch).*
-MR4	MR4		The MR4 has a negative T-land, which gives extremely high edge strength. The chipbreaker is intended for more difficult machining applications on superalloys and titanium alloys, such as intermittent cuts and the machining of parts with raw surface. Recommended machining range: f = 0,15–0,50 mm/rev, a_p = 1,5–7,0 mm. *(f = 0.006–0.020 in/rev, a_p = 0.060–0.280 inch).*
-MR6	MR6		Chipbreaker for medium and medium roughing of steel. Very easy cutting and open geometry. Double and single-sided. Recommended machining range: f = 0,25–0,80 mm/rev, a_p= 0,9–5,0 mm. *(f = 0.010–0.032 in/rev, a_p= 0.035–0.200 inch).*
-MR7	MR7		The strongest chipbreaker for double-sided inserts. The MR7 is suitable for high feed rates and depths of cut that normally require a single-sided insert. The chipbreaker has a wide negative T land, which gives high edge strength. Recommended machining range: f = 0,35–0,90 mm/rev, a_p = 1,5–7,0 mm. *(f = 0.014–0.035 in/rev, a_p = 0.060–0.280 inch).*
-MR9	MR9		The strongest chipbreaker intended for cast iron. The negative chamfers makes it very suitable for high feeds in interupted cuts and still with very reliable action in cast irons. Recommended machining range: f = 0,2-1,0 mm/rev a_p = 1,0-12mm. *(f = 0.008–0.040 in/rev, a_p = 0.040–0.470 inch).*
-R4	R4		Chipbreaker for single-sided inserts. It has a positive cutting edge which gives low cutting forces. Recommended machining range: f = 0,2–0,6 mm/rev, a_p = 2–10 mm. *(f = 0.008–0.024 in/rev, a_p = 0.080–0.400 inch).*
-R5	R5, R57		Chipbreaker for single-sided inserts. Recommended for medium-roughing of steel. Recommended machining range: f = 0,3–1,0 mm/rev, a_p = 2–12 mm. *(f = 0.012–0.040 in/rev, a_p = 0.080–0.475 inch).*
-56 -R56	R6, R56		Chipbreaker with easy-cutting geometry for single-sided inserts. Intended for stainless steel machining applications. Recommended machining range: f = 0,4–0,8 mm/rev, a_p = 2–12 mm. *(f = 0.016–0.032 in/rev, a_p = 0.080–0.470 inch).*
-57 -R57	R5, R57		Chipbreaker for single-sided roughing inserts. Recommended for roughing operations on steel at high feed rates and high depth of cut. Recommended machining range: f = 0,45-1,10 mm/rev, a_p = 2-12 mm. *(f = 0.018–0.042 in/rev, a_p = 0.080–0.470 inch).*
-R6	R6, R56		Chipbreaker for single-sided inserts. Recommended for medium-roughing of stainless steel. Recommended machining range: f = 0,25–0,70 mm/rev, a_p = 2–10 mm. *(f = 0.010–0.028 in/rev, a_p = 0.080–0.400 inch).*
-R68	R7, R68		Chipbreaker for single sided insert. Recommended for heavy-roughing of steel. Recommended machining range: f = 0,4–1,4 mm/rev, a_p = 4–14 mm. *(f = 0.016–0.055 in/rev, a_p = 0.160–0.550 inch).*
-R7	R7, R68		A strong but easy-cutting chipbreaker for single sided inserts. The R7 is well suited for intermittent machining of both stainless and ordinary carbon steel. Recommended machining range: f = 0,4–1,6 mm/rev, a_p = 3–18 mm. *(f = 0.016–0.063 in/rev, a_p = 0.120–0.700 inch).*



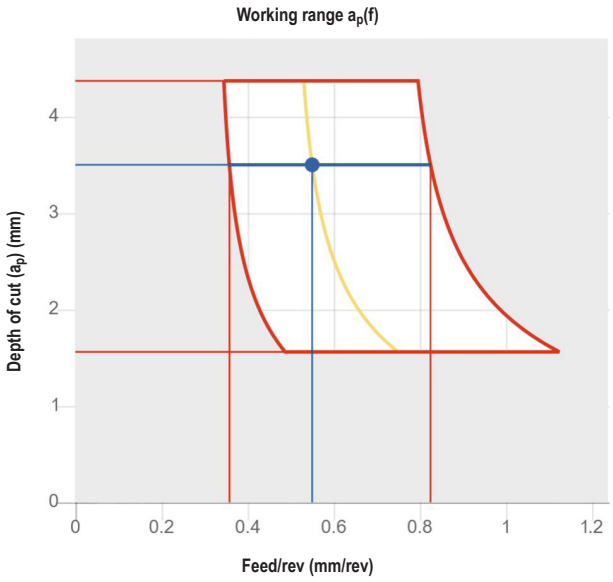
Chipbreaker program, negative basic shape inserts			
-R8	R8		A very strong chipbreaker for single-sided inserts. The R8 is intended for high feed rates when machining castings and forgings of austenitic stainless steel. Recommended machining range: f = 0,35–0,80 mm/rev, a_p = 2–12 mm. *(f = 0.014–0.032 in/rev, a_p = 0.080–0.470 inch).*
-RR6	RR6		A very easy-cutting chipbreaker for single-sided inserts. Recommended for roughing of stainless steel and steel. Recommended machining range: f = 0,3–1,0 mm/rev, a_p = 2–12 mm. *(f = 0.012–0.040 in/rev, a_p = 0.080–0.470 inch).*
-RR9	RR9		Extremely strong chipbreaker for single-sided negative inserts, for use at high feed rates. Suitable for difficult castings and forgings and for austenitic stainless steel. Recommended machining range: f = 0,5–1,2 mm/rev, a_p = 2,5–15,0 mm. *(f = 0.020–0.047 in/rev, a_p = 0.100–0.590 inch).*
-RR96	RR96		Heavy roughing chipbreaker for negative single-sided inserts for high parameters and chip control for all materials. Recommended machining range for LNMX50: f = 1,5–2,6 mm/rev, a_p = 12–36 mm. *(f = 0.060–0.100 in/rev, a_p = 0.470–1.415 inch).*
-UX	UX		Chipbreaker for negative inserts. Positive cutting rake with sharp edge. Low cutting force. Suitable for slim components. Recommended machining range: f = 0,2–0,4 mm/rev, a_p =1,0–6,0 mm. *(f = 0.008–0.016 in/rev, a_p =0.040–0.240 inch).*

Chipbreakers



-MF2 – For finishing

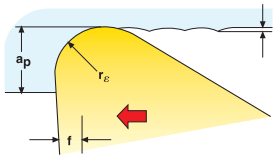
-M3 – For general machining

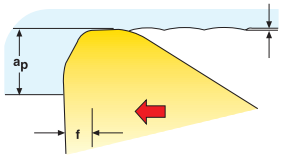


-M5 – For roughing

The design of a chipbreaker is made to give both good chipcontrol and additional functional benefits appropriate for the intended materials, applications and components.

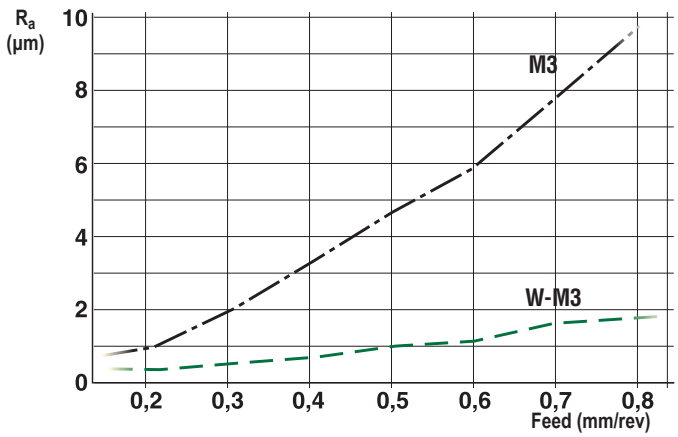
Consequently a number of features on a specific insert differ to adapt to those needs for example as indicated in the drawings.





-MF2, -M3, -M5

For a certain insert and chipbreaker combination there is a recommended working range and depend on several aspects in insert design and of machining conditions such as component and path.



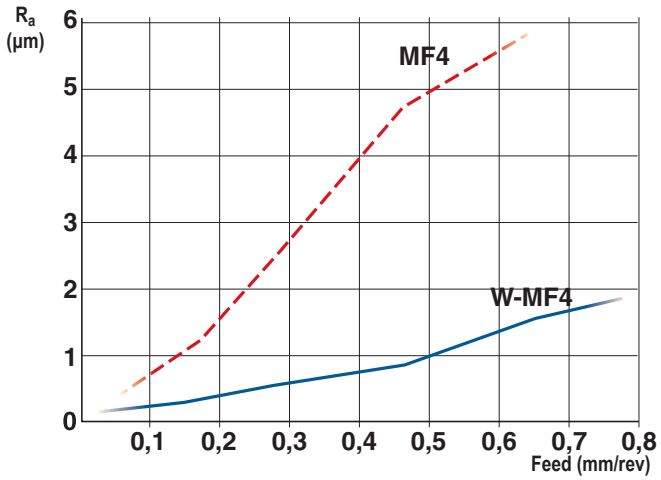
When logged in on www.secotools.com or Mypages specific cutting data graphs for general turning insert are available if Advanced Cutting Data section are expanded.

High Feed Wiper inserts

Standard insert geometry	High Feed Wiper insert geometry
	

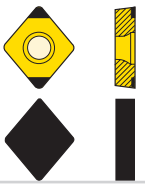
Often comes the question how a High Feed Wiper can generate that significantly better surface finish at the same feed rate compared to standard insert.
When looking closer to the design of an insert edge regardless if either e.g. coated carbide or PCBN insert there are similarities.
Below diagrams show the Ra-value as a function of feed rate when using standard nose radius inserts and High Feed Wiper inserts.
Regardless of chipbreaker design and workpiece material there are solutions available corresponding to the need.

M3 = Standard -M3, W-M3 = Wiper -M3



The diagram shows the superior surface finish in steel achieved with a Seco High Feed W-M3 wiper insert compared to a conventional insert.

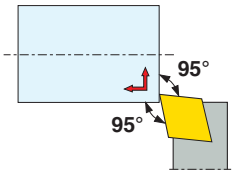
CNMG120408W-M3 TP2501, a_p = 1 mm, cutting speed adjusted for feed, workpiece material: (steel) SMG P4.



Note that opportunities to do the same surface finish comparison for each specific product and application when logged in on www.secotools.com under the Advanced Cutting Data section.

MF4 = Standard -MF4, W-MF4 = Wiper -MF4

When applying a Seco High Feed W-MF4 wiper insert in stainless steel the diagram shows the superior surface finish achieved compared to a conventional insert in stainless steel.

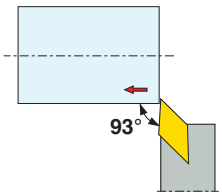


CNMG120408W-MF4 TM2501, a_p = 1 mm, cutting speed tool life adjusted for feed in SMG M2 (stainless steel).

Chipbreaker program, High Feed Wiper inserts			
W-F1	F1		A versatile chipbreaker for positive inserts. For finishing machining of steel, stainless steel and cast iron giving good surface finish. Suitable for high feed rates at small depths of cut. Recommended machining range: f = 0,05-0,50 mm/rev, a_p = 0,25-3,00 mm. *(f = 0.002–0.020 in/rev, a_p = 0.010–0.120 inch).*
W-FF2	FF2		Chipbreaker for high feed finishing of steel and stainless steel. Wide chip control range in finishing and generates a superior surface quality. Recommended machining range: f = 0,1-0,5 mm/rev, a_p = 0,2-1,5 mm. *(f = 0.004-0.020 in/rev, a_p = 0.008-0.060 inch).*
W-MF2	MF2		First choice for finishing with both positive and negative inserts. Chipbreaker suitable for finishing machining of steel, stainless steel and cast iron at high feed rates giving good surface finish. Recommended machining range: f = 0,05-0,60 mm/rev, a_p = 0,5-4,0 mm. *(f = 0.002-0.024 in/rev, a_p = 0.020-0.160 inch).*
W-MF4	MF4		Easy cutting action chipbreaker for high feed machining of stainless steel. Provides good surface finish in finishing operations and High Feed Wiper productivity in medium-roughing machining. Recommended machining range: f = 0,05-0,90 mm/rev, a_p= 0,2 - 6,0 mm. *(f = 0.002-0.035 in/rev, a_p= 0.008 - 0.240 inch).*
W-MF5	MF5		Chipbreaker intended for medium finishing of steel at high feed. The geometry is very open and highly positive and equipped with wiper radius. Recommended machining range: f = 0,2-0,8 mm/rev, a_p = 0,2-2,7 mm. *(f = 0.008-0.032 in/rev, a_p = 0.008-0.105 inch).*
W-M3	M3		Versatile chipbreaker in both positive and negative inserts for high feed finishing and medium-roughing machining of steel, stainless steel and cast iron. Operates in a wide application area. Gives a good surface finish even at high feeds. Recommended machining range: f = 0,2-0,9 mm/rev, a_p = 0,5-6,0 mm. *(f = 0.008-0.035 in/rev, a_p = 0.020-0.240 inch).*
W-M6	M6		Strong double-sided chipbreaker, intended for high-feed semi-roughing and roughing of steel. A well-balanced design combining excellent chip control and relatively low cutting forces which provides reliable cutting action in both continuous as well as interrupted cuts. Recommended machining range: f = 0,3-1,0 mm/rev, a_p = 1,0-7,0 mm. *(f = 0.012-0.040 in/rev, a_p = 0.040-0.275 inch).*
W-R4	R4		Chipbreaker for single sided inserts intended for high feed medium-roughing and rough machining of steel, stainless steel and cast iron. Gives a good surface finish even at high feeds. Low cutting forces. Recommended machining range: f = 0,3-1,0 mm/rev, a_p = 2,0-7,5 mm. *(f = 0.012-0.040 inch/rev, a_p = 0.080-0.295 inch).*
W-R7	R7, R68		A strong easy cutting chipbreaker for single sided inserts. Intended for the highest feeds when medium-roughing and roughing machining of steel, stainless steel and cast iron. Gives a good surface finish even at the higher feeds. Recommended machining range: f = 0,4-1,2 mm/rev, a_p = 2,0-9,5 mm. *(f = 0.016-0.048 in/rev, a_p = 0.080-0.375 inch).*
-WZ **-WZN** **-WZP** **-WS** **-WL**			Wiper geometries on PCBN inserts. Available in various insert styles in solid or brazed format. Developed for machining pearlitic grey cast iron and hardened steel. Gives a high quality surface finish at high feeds.

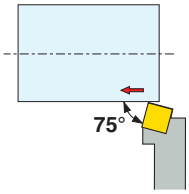
Operation guidelines

C- and W-basic shape High Feed Wiper inserts



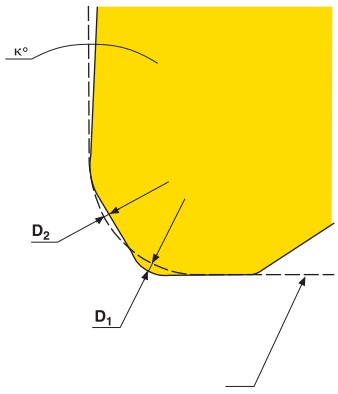
– The favourable surface finish results are lost, if the cutting edge angle diverges from 95°.
– Max diversion allowed: ±2°.
– Back-turning is NOT recommended.

On C-style High Feed inserts, except for PCBN inserts, the wiper geometry is also located on the 100° corner.
When using W-R4 or W-R7 chipbreaker use a toolholder with P- or M-type clamping.



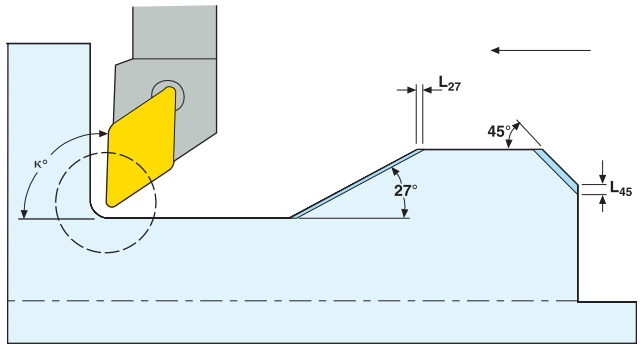
D- and T-basic shape High Feed Wiper inserts

– The favourable surface finish results are lost, if the cutting edge angle diverges from 93°.
– Max diversion allowed: ±2°.
– Back-turning is NOT recommended.



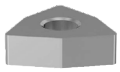
S-basic shape High Feed Wiper inserts

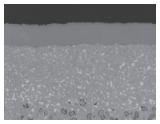
– S-style High Feed insert to be used in a toolholder with 75° setting angle. The favourable surface finish results are lost, if the cutting edge angle diverges from 75°. Max diversion allowed: ±2°.

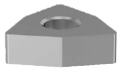


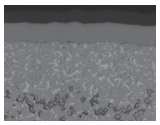
Copying with D- and T-style Wiper inserts

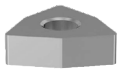
Since D- and T-style High Feed inserts not are designed within ISO-tolerances, an adjustment in the tool offset must be made.
A deviation from the nominal nose radius shape, will always occur (D1, D2) when going towards a corner.

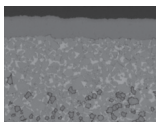


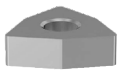


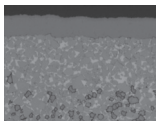


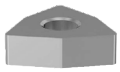


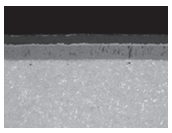


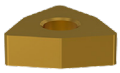


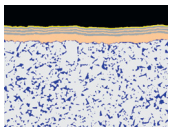


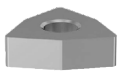


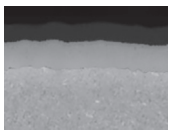


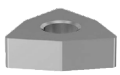


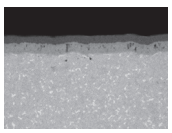


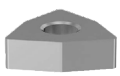


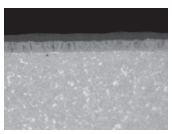


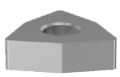


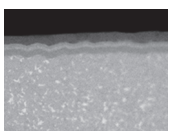




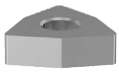


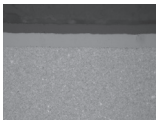


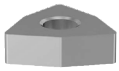


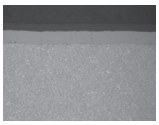


ISO-profile (Nominal nose radius)

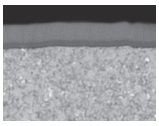


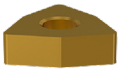


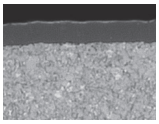


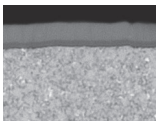


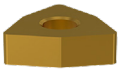
The High Feed geometry on a D-and T-style insert does not provide an exact corner radius.

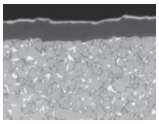


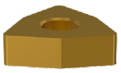


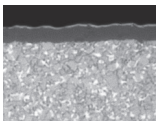


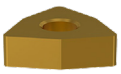


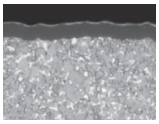


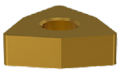


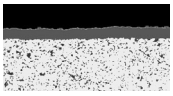


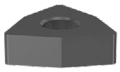


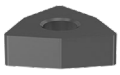


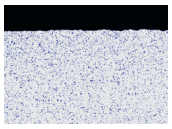


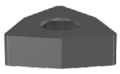


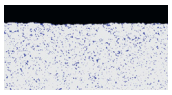


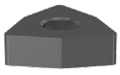


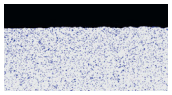




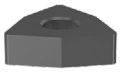


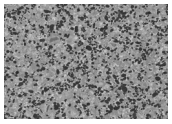


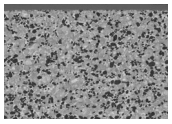




When copying with a D- or T-style High Feed insert, an adjustment must be made for dimensional deviations.





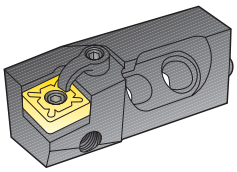


CVD Coated Grades

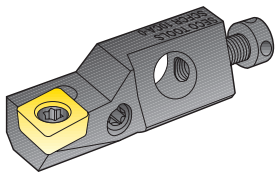
TP0501			Duratomic® grade. A grade with an extremely high degree of heat and wear resistance for many steel applications such as in alloy steels and especially capable under dry conditions. Also applicable for demanding applications in cast irons. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP1501			Duratomic® grade. Highly heat and wear resistant grade extremely well suited for productive general turning of steels and a useful backup in other material groups. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP2501			Duratomic® grade. Designed with high wear resistance and edge strength applicable in a wide range of turning applications in steels as well as many stainless steels and cast irons. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP3501			Duratomic® grade. Enhanced edge toughness still with the characteristic high wear resistance intended for versatile performance in turning applications in steels as well as stainless steels especially including interrupted cuts. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP25			Universal grade for high versatile performance over a wide range of applications in steels, stainless steels and cast irons. Trustworthy alternative at limited cutting speeds or high surface finish requirements. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TP40			Universal grade for a extremely secure performance in the most demanding application from steels, stainless steels to superalloys especially in castings and forgings. TiC/Ti(C,N) + TiN
TH1501			Duratomic® grade. An extremetly hard super micrograin grade intended for machining of partly hardened steels and provides an alternative for cast iron finishing. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TM1501			Duratomic® grade. Highly resistant and optimized grade for many continuous cut in stainless steel turning applications. Complements in mixes of steel and stainless steel turning. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TM2501			Duratomic® grade. A highly capable grade for austenitic stainless steel turning with combinations of high resistance and superior edge toughness. First choice in austenitic stainless steel turning. Complements in steel turning with heavy intermittent cuts. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TM3501			Duratomic® grade. First choice in duplex and more difficult-to-cut stainless steels and highly resistant to notch wear and chipping. Superior in finishing and in intermittent cuts in all stainless steel alloys. Versatile grade, covering a variety of stainless steel alloys and operations. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)

CVD Coated Grades			
TK0501			Duratomic® grade. A extremely wear resistant optimized grade choice for machining of grey cast iron and many ductile cast irons. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)
TK1501			Duratomic® grade. A highly wear resistant grade for cast irons in general as well as in steels. The grade is particularly capable in machining of ductile (nodular) cast irons also in more demanding setups and interrupted cuts. Ti(C,N) + Al_2O_3 + Used Edge Detection (Chrome)

PVD Coated Grades			
TH1000			Very hard supermicrograin grade intended for partly hardened steel components as well as general "hard-to-cut" workpiece materials such as superalloys and due to remarkable edge toughness it also provides high performance in interrupted cuts and hard-surface removal. Ti-Al-Si-N nanolaminate coating
TS2000			Hard micrograin wear resistant grade intended for finishing in superalloys and titanium as well as in many stainless steels. (Ti,Al)N + TiN
TS2050			Hard and wear resistant micrograin grade intended for finishing and semi-finishing of superalloys. Ti-Al-Si-N nanolaminate coating
TS2500			Relatively hard micrograin grade for machining of superalloys and titanium in roughing applications and due to its design also applicable in a wide range of materials such as stainless steels. (Ti,Al)N + TiN
CP200			Hard micrograin grade principally intended for finishing in superalloys and titanium. Also works well in stainless steels. (Ti, Al) N + TiN
CP500			Tough micrograin grade intended for finishing to medium-roughing of stainless steels but with wide applicability for example in steels and aluminium alloys. Especially suitable in intermittent cuts. (Ti,Al)N + TiN
CP600			Very tough micrograin grade intended for stainless steels and steels applicable but generally applicable when ever high edge toughness required e.g. more difficult interrupted cuts. (Ti,Al)N + TiN



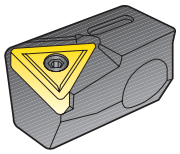
Uncoated Grades			
HX			Universal uncoated grade intended for machining of cast iron and hardened steels useful also in non-ferrous materials.
KX			Optimized micrograin grade intended for the machining of aluminium and other non-ferrous materials.
883			Relatively hard and still tough uncoated micrograin grade for machining of titanium in roughing applications and also suitable for superalloys.
890			High hardness uncoated micrograin grade maintaining good toughness intended for superalloys and titanium can also be applied in other materials.



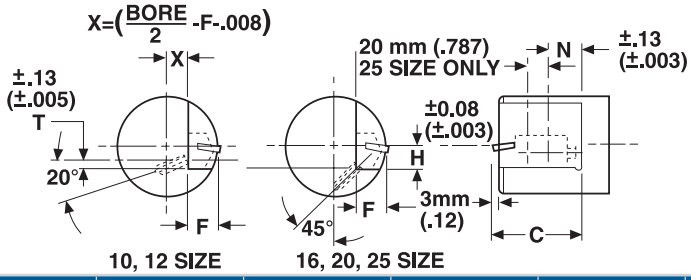
Cermet			
TP1020			High wear resistance cermet grade for highest surface finish with predictability, first of all, in steels and stainless steels.
TP1030			Coated highly wear resistant cermet grade for high surface finish and productivity requirements mainly used in steels and stainless steels. Ti-Al-Si-N nanolaminate coating.

Cartridges – Mounting information

Angular Mount Cartridges



– Conform to ISO-ANSI standards
– Accomodate positive and negative rakes
– Use standard, interchangeable Seco seats and chipbreakers
– Fit any cat-head, boring bar or tool block
– now using ISO-ANSI cartridges
– Allow axial and radial adjustment
– Instant metric/inch conversion with simple substitution of components



90° Mount Cartridges

– Provide close-tolerance machining with radial and axial adjustments of M and PC types

Mounting Information: ISO-ANSI, Angular Mount Cartridges

Railway wheels – Introduction

Turning – New railway wheels

The product range consists of:

– Inserts for finish machining RCMT-R3 and RCMX-R3 geometries
– Inserts for rough machining RR93, H-RR93 & RR94 geometries
– Inserts for heavy roughing at high feed rate RR97 geometry
– Solid PRDCN toolholders up to 50x50 shank
– Seco-Capto™ custom made toolholders

R3

Stong geometries for finishing and semi finishing at high feet rates

RCMX-R3

RCMT-R3

Feed recommendation: 0,5-1,2 mm/rev / *0.002-0.047 in/rev*
D.O.C. recommendation: a_p < 5 mm / *0.197 inch*

RR94, RR93

Stong geometries for medium machining and roughing at high feet rates

RCMX-RR94

RCMX-RR93

RCMX-H-RR93

Feed recommendation: 0,6-1,4 mm/rev / *0.024-0.055 in/rev*
D.O.C. recommendation: a_p < 12 mm / *0.472 inch*

RCMX-RR97

Strong geometries for machining at high feed rates.

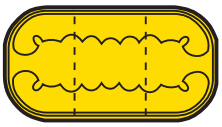
Feed recommendation: 0,6-1,5 mm/rev / *0.024-0.059 in/rev*
D.O.C. recommendation: a_p < 15 mm / *0.591 inch*

SNMM-R7

For roughing operations at high feed rates and large depth of cut.

Feed recommendation: 0,6-1,2 mm/rev / *0.024-0.047 in/rev*
D.O.C. recommendation: a_p < 15 mm / *0.591 inch*

R3, RR93 geometries with the chipbreaker grooves and bumps improves the chipbreaking.
Seco dedicated Duratomic® grades improves the performance.

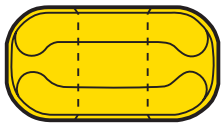


Railway wheel re-turning

The product range consists of:

– Inserts for finish machining MF and R2 geometries
– Inserts for medium rough machining RR94 geometry
– Inserts for rough machining MR and RR97 geometries
– Edge strength order R2-MF-RR94-MR-RR97
– Cassettes for railway wheel re-turning RWRT

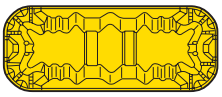
LNMX-MF



For re-machining at small depth of cut. (Normally used when machining with an under floor lathe.)

Feed recommendation: 0,4-1,0 mm/rev / *0.016-0.039 in/rev*
D.O.C. recommendation: ap < 10 mm / *0.394 inch*

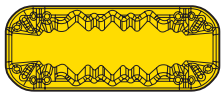
LNMX-MR



Basic choice for re-machining.

Feed recommendation: 0,6-2,0 mm/rev / *0.024-0.079 in/rev*
D.O.C. recommendation: ap < 15 mm / *0.591 inch*

LNMX-R2

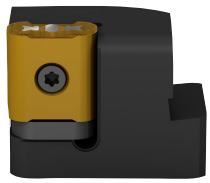


R2 – for less worn out, soft wheels for best chip control.

Feed recommendation: 0,40-1,10 mm/rev / *0.016-0.043 in/rev*
D.O.C. recommendation: ap = 2-5 mm / *0.079-0.197 inch*

LNMX-RR94

RR94 – for the moderately damaged wheels.

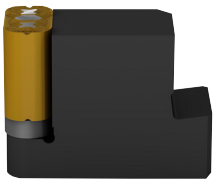


D.O.C. and feed recommendation:
LNMX19, ap = 2-5 mm / *0.079-0.197 inch*; f = 0,45-1,40 mm/rev / *0.018-0.055 in/rev*
LNMX30, ap = 2-10 mm / *0.079-0.394 inch*; f = 0,55-1,80 mm/rev / *0.022-0.071 in/rev*

Cassettes for railway wheel re-turning RWRT

Standard products

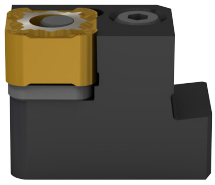
CT-PLANR/L (R/L175.32)



Pin clamped cassettes for LNMX19 and LNMX30

Right-hand version shown

CT-PLFNR/L (R/L177.32-3219-19)



Pin clamped cassettes for LNMX19 and LNMX30

Right-hand version shown

CT-PSANR/L

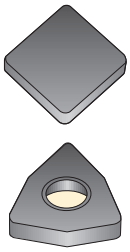
Lever clamped cassettes for SNMX1911

Right-hand version shown

The cassettes are equipped with carbide shims for insert support and cassette protection.
The toolholders for these cassettes are machine specific. The combination cassettes are also machine specific. Some of them are offered as specials.

Selection of insert format – PCBN

Insert grades – PCBN



Uncoated:

CBN010
CBN150
CBN170

PCBN grades, coated		
CH0550		Format: Solid & brazed tips (single & double sided). Composition: 40% cBN bi-modal grain size distribution with average grain size of 3 µm and a TiCN ceramic binder. Coating: (Ti, Al, Cr)N coating
CH1050		Format: Solid & brazed tips (single sided). Composition: 55% cBN average grain size 2 µm and TiCN ceramic binder Coating: (Ti, Al, Cr)N coating
CBN060K		Format: Solid & brazed tips (single & double sided). Composition: 60% cBN content grade with an average grain size of 1-2 µm and a TiCN ceramic binder. Coating: (Ti, Al, Si)N coating.
CH2540		Format: Solid & brazed tips (single sided). Composition: 65% cBN bi-modal grain size distribution with average grain size of 6 µm and a TiCN ceramic binder. Coating: (Ti, Si)N coating.
CH2581		Format: Solid & brazed tips (single sided). Composition: 75% cBN average grain size 3-4 µm and TiCN ceramic binder. Coating: TiAlN coating.
CH3515		Format: Full-face layer & brazed tips (single sided). Composition: 90% cBN average grain size of 4 µm and a AlN ceramic binder. Coating: (Ti, Al)N coating.
CBN300P		Format: Solid. Composition: 90% cBN content grade with an average grain size of 22 µm and a Al ceramic binder. Coating: (Ti, Al)N coating.
CK2065		Format: Solid Composition: 90% cBN content grade with an average grain size of 22 µm and a Al ceramic binder. Coating: Wear detection coating
CBN400C		Format: Solid. Composition: 90% cBN content grade with an average grain size of 3-6 µm and a Al ceramic binder. Coating: (Ti, Si)N coating.

PCBN grades, uncoated		
CBN010		Format: Solid, full-face layer and brazed tips (single & double sided). Composition: 50% cBN content grade with an average grain size of 2 µm and a TiC ceramic binder. Coating: No coating.
CBN150		Format: Solid and brazed tips (single sided). Composition: 45% cBN content grade with an average grain size of < 1 µm and a TiCN ceramic binder. Coating: No coating.
CBN170		Format: Solid and brazed tips (single & double sided). Composition: 65% cBN content grade with an average grain size of 2 µm and a TiCN+SiCw ceramic binder. Coating: No coating.
CBN200		Format: Full-face layer and brazed tips (single sided). Composition: 85% cBN content grade with an average grain size of 2 µm and a Co-W-Al ceramic binder. Coating: No coating.
CBN200		Format: Solid. Composition: 90% cBN content grade with an average grain size of 3-6 µm and a Al ceramic binder. Coating: No coating.
CBN300		Format: Solid. Composition: 90% cBN content grade with an average grain size of 22 µm and a Al ceramic binder. Coating: No coating.
CBN500		Format: Solid. Composition: 90% cBN content grade with an average grain size of 15 µm and a Al ceramic binder. Coating: No coating.
CBN600		Format: Solid. Composition: 90% cBN content grade with multi modal grain size and Al ceramic binding. Coating: No coating.

PCBN High Feed Wiper inserts – Introduction

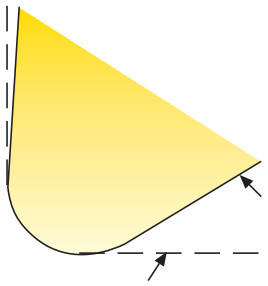
The surface finish in a turning operation is affected by a great number of factors. Two of the most important factors are feed rate and the size of the corner radius. A relation commonly used in industry when choosing relevant cutting data regarding feed and surface finish, is that R_a roughly can be said to increase with the square of the feed rate and decrease with increased size of the corner radius. At least this was the case before the development of wiper geometries designed for high feed finishing, which is now gaining popularity in the metalworking industry. Wiper geometries changed this relationship with the capability to generate high surface finishes even at higher feed rates.

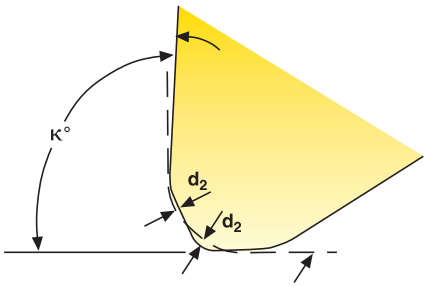
Seco High Feed Wiper inserts combine the high feed capability and high quality surface finish given by large round inserts and the low cutting forces and flexibility permitted by sharp pointed inserts. This can be achieved by the fact that the main part of the radial cutting force is generated by the main cutting edge. By transferring a small part of the round insert edges into the straight cutting edges of the pointed insert, an insert design adjusted for high feed machining producing superior surface finish is achieved.

General hints

– Use a High Feed Wiper insert to increase the feed without sacrificing surface finish, relative to conventional insert geometries.

– Use a High Feed Wiper insert to eliminate grinding operations. In many cases it is possible to obtain surface finishes and dimensional tolerances previously only possible with a final grinding operation.





Seco has four different types of wiper geometries designed for optimum performance in different applications:

– Conventional wiper	-WZ
– Crossbill™ wiper	-L-WZ and -R-WZ
– Helix™ wiper	-WZN and -WZP
– Long/short wiper	-WL/-WS

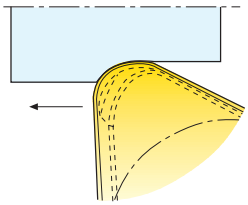
Conventional PCBN High Feed Wiper inserts

A conventional High Feed Wiper insert consists of a large radius added to the insert outside the nose radius. This wiper segment is added on both sides of the nose radius, allowing for turning left or right.

The Seco range of conventional High Feed Wiper products include all commonly used inserts shapes.

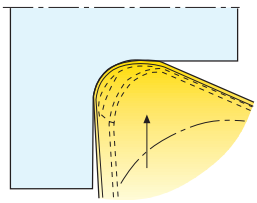
Standard insert	PCBN High Feed Wiper insert
	
Standard insert-profile (Nominal nose radius)	Standard insert-profile (Nominal nose radius)

Seco Crossbill™ High Feed Wiper insert



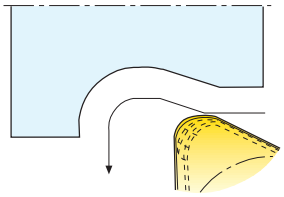
A deviation from the normal radius shape will always occur when a standard wiper geometry is used to machine towards a corner/face.

The Crossbill High Feed Wiper insert gives the opportunity to produce a radius without deviation from the normal shape and without losing the advantages from a standard High Feed Wiper insert.

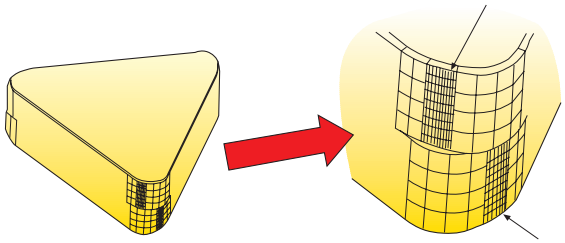


The Seco Crossbill™ High Feed Wiper inserts are available in PCBN grade CBN010 and CBN060K.

Design/Function



Axial turning (full wiper effect)



Facing (no wiper effect)

Copying (no deviation forming a radius)

Right-hand version

Wiper segment

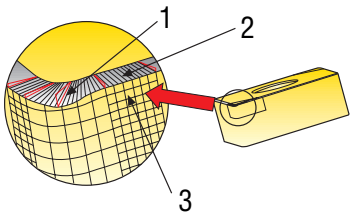
Wiper segment

Seco Helix™ High Feed Wiper insert

Our unique patented, Helix™ High Feed Wiper concept is designed for optimization in finish machining. It has a wiper on both sides of the corner radii (as the standard) but the protection chamfer is twisted from negative to positive or from positive to negative depending on the application.

It is available in grade CH0550, CBN060K and CBN010.

Design/Function



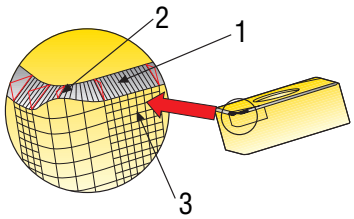
The following considerations apply when selecting the appropriate geometry:

Positive Wiper, WZP

– Reducing vibrations in weak set-ups

– Lower radial cutting forces

– Used where standard wiper cannot be used

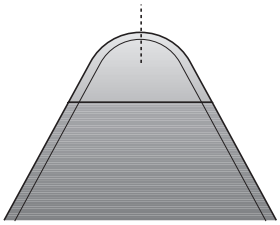


1. Big angle
2. Small angle
3. Wiper section

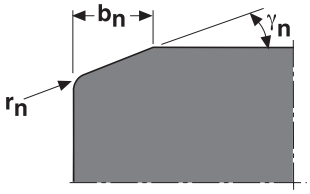
Negative Wiper, WZN

– Longer tool life

– Reducing vibrations in stable set-ups



– Increasing compressive stresses



1. Big angle
2. Small angle
3. Wiper section

PCBN – Edge preparation

Edge preparation

b_n = Chamfer width
γ_n = Chamfer angle
r_n = Hone radius

Geometry recommendations

Strong cutting edge geometries are always preferred.
– Negative cutting geometry
– Chamfered cutting edge
– Large nose radius

Sharp positive cutting edge geometry can be advantageous when:
– Finishing of small hardened bores without interruptions
– Finishing of unstable components without interruptions
– Finishing of pearlitic grey cast iron

PCBN – Geometry

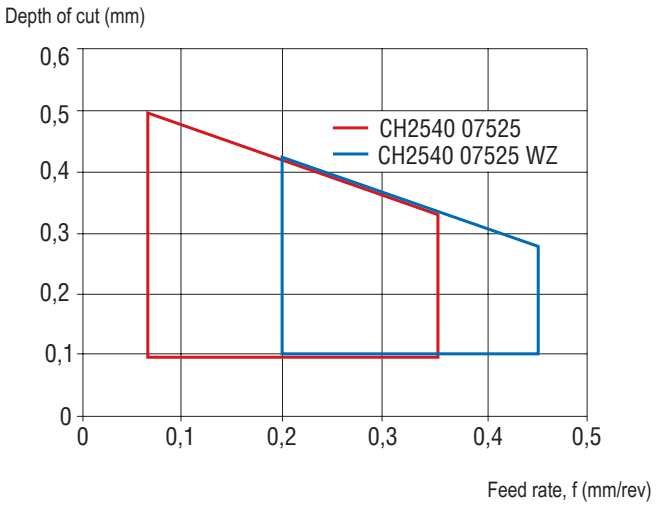
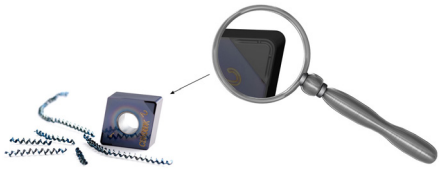
PCBN Chipbreaker inserts



The laser machined chipbreaker comes in two different styles, one for low and one for high feed applications. The non-wiper Secomax™ chipbreaker insert makes it possible to have good chip control when low feed rates are used. The wiper Secomax™ chipbreaker insert provides improved chip control when using high feed rates.

Secomax PCBN, non-wiper and wiper chipbreaker inserts

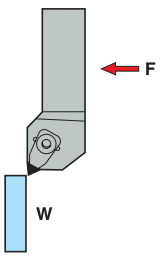


Application area grade CBN060K

Application area grade CH2540

Laser machining provides several benefi ts over conventional production technologies such as grinding. Laser technology meets the highest requirements regarding dimensional accuracy, geometrical precision and surface quality for the machining of complex, three-dimensional geometries. These advantages and possibilities have led to a complex formed chipbreaker with “bumps” that would have been impossible to produce with any other production technology.

Plunge Turning



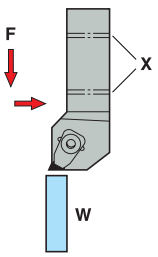
The vast majority of heat treated components in the metalworking industry are machined to their final geometrical form after hardening.

Seco have developed a method in hard turning, the Seco patented Plunge Turning.

The plunging process consists of an orthogonal cut, using the solid CBN010, CBN150, CBN060K, CH0550, CH1050, CH2540, CH2581.

Using the Plunge Turning method gives two great advantages compared to conventional hard turning, reduction in cutting time (up to 90%) and improved surface integrity.

Conventional Turning



F = Feed direction
W = Workpiece

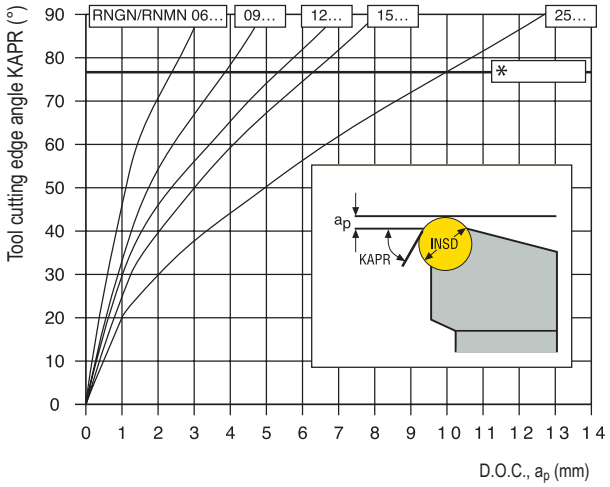
Cutting time 5 seconds

General cutting data recommendation for Plunge Turning is v_c = 200-400 m/min / *656-1312 sfm* and f = 0,04 mm/rev / *0.0016 in/rev*.

To avoid the cutting edge profile affecting surface finish, complete the operation with a small axial movement.

Plunge Turning

F = Feed direction
W = Workpiece
X = Set screws



Cutting time 0,5 seconds

In addition to the introduction of the Plunge Turning method there are also some standard toolholders. These toolholders have set screws which give the possibility to adjust the toolholder to an exact setting angle. The toolholders have a designation ending with – PL, and are available for inserts in sizes T..11 and T..16.

Maximum depth of cut recommendations

Round inserts

Round inserts

* = KAPR limited
The tool cutting edge angle is limited to 75° resulting in maximum depth of cut (a_p).

PCBN, SMG

Cast Irons

SMG	Description	Reference	Recommendations
K1	Grey cast irons (GCI)	EN-GJL-250	First choice in dry machining: CBN300. Universal option: CBN600. First choice when coolant is used: CBN200. First choice for finish machining: CBN400C. Adjust the depth of cut to get under the casting skin and blow holes.
K4	Nodular cast irons (SGI)	EN-GJS-500-7	First choice for finish machining: CBN010.

Superalloys and Titanium

SMG	Description	Reference	Recommendations
S1	Iron-based superalloys	Discalloy	First choice for finish machining: CBN010 with E25 edge preparation. Use coolant.
S2	Cobalt-based superalloys	Stellite 21	First choice for finish machining: CBN010 with E25 edge preparation. Use coolant.
S3	Nickel-based superalloys	Inconel 718	PCBN tools can be used on Inconel 718 with following properties. Solution annealed + age hardened Direct age hardened Hardness 32 – 44 Hrc First choice for finish machining: CBN170. Use coolant.

Hard Materials

SMG	Description	Reference	Recommendations
H3	Case-hardened steels	16 MnCr 5 60 HRC	Dry machining is preferable. Coolant can be used. The chips should be fully annealed and brittle. First choice for finish machining: CH0550/CH1050. Universal grade for finish machining: CBN010. For high surface finish requirements, use CBN150/ CH1050. **In interrupted machining:** Moderate interruptions, use CBN060K/CBN010/CH2540. Aggressive interruptions, use CH2581/CH3515/CBN150. Reduce the feed rate. Machine without coolant. If possible, chamfer any sharp edges of the workpiece before machining.
H7	Quenched & Tempered steels Bearing steels	100 Cr 6 60 HRC	Dry machining is preferable. Coolant can be used. The chips should be fully annealed and brittle. First choice for finish machining: CBN060K/CH1050. Universal grade for finish machining: CBN010. For rough machining, use CBN200/CBN300. For high surface finish requirements, use CH1050. **In interrupted machining:** Moderate interruptions, use CBN060K/CBN010/CH2540. Aggressive interruptions, use CH2581/CH3515/CBN150. Reduce the feed rate. Machine without coolant. If possible, chamfer any sharp edges of the workpiece before machining.
H8	Tool steels High Speed Steels (HSS)	X 40 CrMoV 5 1 50 HRC	First choice for finish machining: CBN010. First choice for rough machining: CBN200. Interrupted machining of high speed steels can not be done.
H11	Martensitic stainless steels	X 20 Cr 13 45 HRC	First choice for finish machining: CBN010. First choice for rough machining: CBN300. **In interrupted machining:** Moderate interruptions, use CBN010. Aggressive interruptions, use CH2540/CH3515/CBN150.
H21	Manganese steels	X 120 Mn 12 50 HRC	First choice CBN300. When a tougher grade is needed use CBN500. Use chamfered inserts. Use stable toolholder and rigid clamping of the workpiece. Machine without coolant. Chamfer workpiece edges first.
H31	White cast irons	EN-GJN-HV600(XCr11) 55 HRC	Use CBN500 or when centerlock inserts are used CBN200. Universal option: CBN600. Adjust the depth of cut to get under the casting skin and blow holes. Dry machining is preferable.

Other Difficult Materials

SMG	Description	Reference	Recommendations
PM1	Low-alloy PM-materials	F-0008 Fe-0.7C	PCBN tools can be used on PM parts as soft as 25 HRC. The critical parameter is particle hardness, when the particle hardness exceeds 50 HRC, PCBN is useful, no matter what the bulk hardness is. First choice CBN200. Second choice CH3515. For rough machining CBN300 is an alternative. Use chamfered inserts, S25 edge preparation. Do not use coolant for interrupted cut.
PM2	Medium-alloy PM-materials	FLC-4608 Fe2Cu1.8Ni 0.5Mo0.2Mn0.8C	PCBN tools can be used on PM parts as soft as 25 HRC. The critical parameter is particle hardness, when the particle hardness exceeds 50 HRC, PCBN is useful, no matter what the bulk hardness is. First choice CBN200. Second choice CH3515. For rough machining CBN300 is an alternative. Use chamfered inserts, S25 edge preparation. Do not use coolant for interrupted cut.
PM3	High-alloy PM-materials Exhaust valve seat materials, etc.		First choice CBN150. Second choice CBN010. Use positive inserts. Use chamfered and honed edges for longer tool life. Use honed edges when tight tolerances are required. Machining can be carried out either with or without coolant.
HF1	Hardfacing alloys Welded or plasma-deposited iron-based alloys		Cr-based alloys – Hardness <60 HRC. Co-based alloys – Hardness >35 HRC. Ni-based alloys – Hardness >35 HRC. Fe-based alloys – Hardness >35 HRC. First choice for finish machining: CBN010. First choice for rough machining: CBN500, or when centerlock inserts are used: CBN200. Use round inserts if possible. Use chamfered inserts. Adjust the depth of cut to get under the welding skin and blow holes. Dry machining is preferable. Remove any weld spatter before machining.
HF2	Hardfacing alloys Welded or plasma-deposited cobalt- and nickel-based alloys		Cr-based alloys – Hardness <60 HRC. Co-based alloys – Hardness >35 HRC. Ni-based alloys – Hardness >35 HRC. Fe-based alloys – Hardness >35 HRC. First choice for finish machining: CBN010. First choice for rough machining: CBN500, or when centerlock inserts are used: CBN200. Use round inserts if possible. Use chamfered inserts. Adjust the depth of cut to get under the welding skin and blow holes. Dry machining is preferable. Remove any weld spatter before machining.
CC1	Sintered tungsten carbide	G50	Sintered tungsten carbide with a Co content >17%. **Basic conditions:** Use CBN300. When a tougher grade is needed use CBN500. Use round inserts. Use chamfered inserts. Machining with coolant is preferable. Chamfer the workpiece at entry and exit.

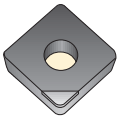
Selection of insert format – PCD

Sintered layer -LF

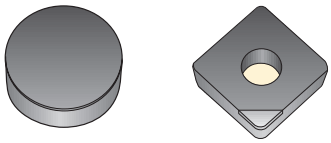


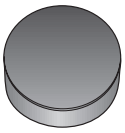
PCD sintered on carbide.
All cutting edges on one side are usable.

Grade:
PCD30

Toolholder style:
C

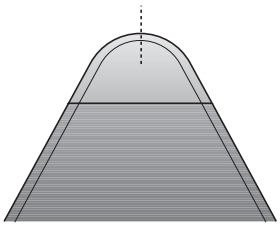
Brazed tip insert -L1



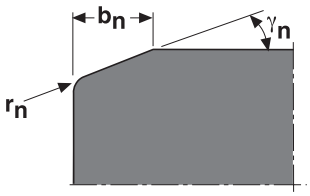


PCD brazed on to standard carbide inserts.

Grades:
PCD20, PCD30



Toolholder styles:
D, P, M and C



PCD grades, uncoated

PCD20		Format: Full-face sintered layer and brazed tips (single sided). Composition: Grade with an average grain size of 10 µm and a Co binder. Coating: No coating.
PCD30		Format: Full-face sintered layer (single sided). Composition: Grade with an average grain size of 25 µm and a Co binder. Coating: No coating.

PCD – Edge preparation

Edge preparation

b_n = Chamfer width
γ_n = Chamfer angle
r_n = Hone radius

Geometry recommendations	Edge preparation
A sharp cutting edge is always recommended.	F = Sharp cutting edge

PCD, SMG

Non Ferrous Metals

SMG	Description	Reference	Recommendations
N1	Aluminium alloys, Si < 9%	AW-7075	First choice for finish and rough machining: PCD20.
N2	Aluminium alloys, 9% < Si < 16%	AC-44200 Si = 12%	First choice for finish and rough machining: PCD20.
N3	Aluminium alloys, Si >16%	AlSi17Cu5	First choice for finish and rough machining: PCD30.
N11	Copper alloys	CW614N	First choice for finish and rough machining: PCD20.

Other Difficult Materials

SMG	Description	Reference	Recommendations
CC1	Sintered tungsten carbide	G50	First choice for finish machining: PCD30.

Plastics and Composites

SMG	Description	Reference	Recommendations
TS1	Thermosetting polymers	Urea formaldehyde (UF)	First choice for finish and rough machining: PCD20.
TS2	Thermosetting carbon-fibre composites	T300 T700 T800 HTA-S IMA - Epoxy (M21)...	First choice for finish and rough machining: PCD20.
TS3	Thermosetting glass-fibre composites	Epoxy - HX..(42..)/E glass (7781...)...	First choice for finish and rough machining: PCD20.
TS4	Thermosetting aramide-fibre composites	Kevlar 49	First choice for finish and rough machining: PCD20.
TP1	Thermoplastic polymers	Polycarbonate (PC)	First choice for finish and rough machining: PCD20.
TP2	Thermoplastic carbon-fibre composites	PPS/PEEK - T300..	First choice for finish and rough machining: PCD20.

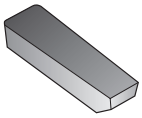
Selection of insert format – Ceramic

Ceramic inserts are only available in solid format.

Solid insert

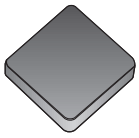


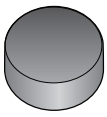
According to the geometry, two sides can be used.

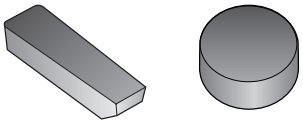
Grade:
CS100, CS300, CW100

Toolholder style:
C

Solid insert

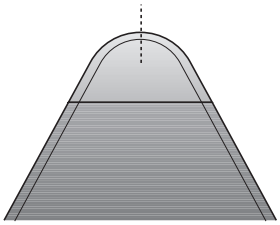




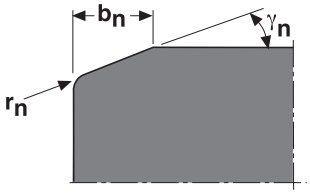


According to the geometry, one edge can be used.

Grade:
CW100



Toolholder style:
CFxx



Ceramic grades, uncoated

CS100		Format: Solid. Composition: Sialon (Si, Al, O, N) ceramic grade. Coating: No coating.
CS300		Format: Solid. Composition: Sialon (Si, Al, O, N) ceramic grade. Coating: No coating.
CW100		Format: Solid. Composition: Aluminium oxide (Al_2O_3) + SiC-whisker reinforced ceramic grade. Coating: No coating.

Ceramics – Edge peparation

Edge preparation

b_n = Chamfer width
γ_n = Chamfer angle
r_n = Hone radius

Geometry recommendations	Edge preparation	Chamfer size and angle
Strong cutting edge geometries are always preferred. – Negative cutting geometry – Chamfered cutting edge – Large nose radius	S = Chamfered and honed T = Chamfered, no honing E = Honed	CS100 = T or S = 0,10 mm x 20° CS300 = T = 0,10 mm x 20° CW100 = Honed or T = 0,10 mm x 20°

Ceramics, SMG

Superalloys

SMG	Description	Reference	Recommendations
S1	Iron-based superalloys	Discalloy	First choice for rough machining: CS100 First choice for grooving: CW100 Use coolant

General ISO Turning holders for general turning machining

Seco offers a wide product range of ISO Turning holders. Jetstream Tooling® toolholders deliver coolant effectively through the toolholder to the optimum position close to the cutting edge. This improves chip control by lifting the chip away from the rake face and reducing the heat load, enabling longer tool life and drastically increasing cutting data to be applied. A comprehensive range of insert types, shapes and sizes are available.

- D Toolholder, first choice for stable clamping in general machining
- P Toolholder, complement reliable clamping in general machining e.g. more chip space required
- C Toolholder, designed mainly for SECO PCBN and Ceramic inserts without hole
- S Toolholder, first choice mainly for smaller inserts in general machining
